An R7A just sold for more than $2K on Ebay. Is that a record?
BTW- How come all the ticket buyers so far are ham's? Seems unlikely.

Leader is still active in supplying them. I'm assuming you need the service manual. I called them and spoke to a lady in their parts department who emailed me the owners' manual for free and quoted me US$80 for a printed copy of the service manual. I couldn't find a freebee service manual for my 8100 'scope though. If you find a source, thanks for letting me know.

see Leader at http://www.leaderusa.com/

>
====================================

To solve the problem of calculating the four values of the trimming and
padding capacitors, two coil inductances, for given capacitance of the main
two-gang tuning capacitor, and for given edges of the frequency band,
involves the solution of four simultaneous quadratic eequations.

Edwin would have needed the assistance of at least a pencil and an empty
cigarette pack.
```

8. Help CVM Transofrmer use

Newsgroup: rec.radio.amateur.boatanchors
Date: 2004-01-01 19:24:23 UTC
From: Carl WA1KPD <nantucketbound@yahoo.com>
Message-ID: <xaGdnfrTmcp07mmiRVn-hg@comcast.com>
Source record: 26619

I am trying to use a UTC CVM transformer and am having trouble understanding
the pins to use.
I have a pair of 6L6s which call for 6600 ct input.
The charts I have been able to find call for the following:

P-B-B-P
1-3-4-6
see http://www.amwindow.org/tech/htm/modtran/utc/cvm.htm

I am not sure how this connection works as I cannot seem to get a Grid-CT-
Grid resistance reading that makes sense. Can anyone help me ?

Thanks and 73

The CC-AWA Winter Swap Meet is just 23 days away.
There has been some confusion about the date,
It has been in the past on the last Saturday in the
month.
This year the swap meet in on the 24th of January.
That's the TWENTY FORTH...

You can find complete driving directions on the
Winter Swap Meet web page at;
http://cc_awa.homestead.com/Winter.html

As always, CC-AWA swap meets are on
Saturday morning, they start early, around 7AM,
and end early, before Noon.
And admission is always FREE.

See ya there.

The manuel says rated at 250 watts transmitter input power, so I would guess that would mean about 200 watts output. I've run 500 watts output into the set I am using and had no heating or arcing. Remember, when they rated something years ago, they were usually very conservative and these are open air coils - there is no core.

Ratio can be set for 1:1 or 4:1 by minor rewiring. I've always run them at 4:1 and fed ladder line.

Input is a PL259, output is two ceramic feed through terminals with nuts.

I have two of the units and wouldn't give them up for anything.

Source record: 26634

I don't have your origional post but thought it had a P--B-B--P connection. P goes to one of the 6V6 plates, B-B are tied together for CT which will be Modulator B+ connection, and the other P will be the other 6V6 plate. The connections are the primary and for Push Pull 6V6 modulator tubes. The other connections are for the secondary and usually have two windings which can be connected in series or parrlall <s> depending on the turns ratio/Z required and feed the RF final amplifier tube. It goes in series with the B+ lead to the final. Your post sounded like you were looking for a Push Pull "input" for the grids of the 6V6's? Regards, Sparks W4EAS

I came up with some old tubes while cleaning out some boxes in the
shop.

There are two 6979s that appear to be new, or at least unused. who
knows what shape after this many years.

They look like 4CX250s, or something similar.
Any one know what they are for sure?

I also came up with a pair of 5894As, still wrapped up.

Then I found one that is going to have to remain unidentified as it is
one of the conduction cooled tubes the same size as the 8873, 4 and 5
series. It could be one of those triodes, or a tetrode used in VHF
base and repeaters. Unfortunately there are no markings on that one.

Is the TL-922A still available from Kenwood, or does Kenwood offer a
linear amp for amateure use currently?
Sorry I've bee out of the loop for awhile.

Look at
http://www.wps.com/archives/tube-datasheets/Datasheets/Amperex-CC-363/6.JPG

> I also came up with a pair of 5894As, still wrapped up.
and I hope you will find there any other tube data.
Thank you for asking, that intends me to ask Google for "tube 6979" and this
homepage is bookmarked now.

I have for sale a nice Yaesu FP-301 Power Supply. This PS will handle over
20 amps at 13.8 Volts.
It was designed to work with the FT-301 Transceiver and the plug is wired
for this radio, but it will
work with any radio requiring the specified amps and volts, but plug will
need to be rewired.
The PS looks almost new. It works great. Price is $75 plus shipping from
79602.
Thanks, Charlie Hugg, K5MbX

The site only has a capacity of ten users and it is usually busy. I
tried yesterday and today and got the message. Try it at about 2 in the
morning and it might work. They just need a better server or ISP. I have
gotten some good schematics for my Hammarlund, Hallicrafters, RME, etc.
from them.

Hello..
I have been looking 'high and low' for a copy of the LMO
schematic for the SB line of radios. I tried all of the Heath forums
that I am aware of. Does anyone know where there exists (not BAMA)
a schematic of the solid state (heck, I would take the tube version)
version of the LMO. I would have thought that after all these years
someone would show up with a copy of the schematic as well as the
alignment instructions. I realize that Heath never made public this
information, but I would have figured somebody would have reverse
engineered these units and documented what he/she discovered.
If I had a dead unit, I would take on the challeng and make
public my findings.

Anyone with any knowledge regarding aligning the units?

Thanks..

I have the schematic of the LMO. It is on a "D" size print, but is so old
and the paper was not acid free that it's very yellowed. Just barely able to
make it out and certainly not xeroxable. Give me a snail mail address and
I'll send it to you, but I'd like it back when you finish with it.

There have been a few postings here about the Clough-Brengle OC
signal generator. Another reader was kind enough to email me a few
pages from "Modern Radio Servicing" on the OC and I scanned in the
manual, along with an advert for the OC.

You can find them at:

http://novatech-instr.com/Fun/cb_1.pdf (manual)
http://novatech-instr.com/Fun/cb_man1.pdf (servicing)

Both files are pretty big (1.4M and 1.2M) so you get a nice readable copy.

Have fun.

Steve.

It was published in QST when the SB-100 was reviewed. However, note that the LMO was made by several different manufacturers to Heath's specs and that there may be significant internal differences. Heath simply specified the dimensions, connections, tube type and electrical performance, and left the rest up to the subcontractor. They treated the LMO as a "component", just like the crystal filters or the power transformer.

Good luck!

Jim,

No first hand experience but if you go to BAMA (bama.sbc.edu) and download the SB-101 technical description (it is in deja vu format) you will find the LMO schematic on Heath manual page 151 (deja vu page 35). A description of the function is found on Heath manual page 132 (deja vu page 14). Then if you download the SB-100 alignment instructions, again from BAMA, you will find a short instruction on adjusting the frequency shift control of the LMO in the SB-100 alignment proceedures. This is all for the 6CB8 tube version.

If you go to http://www.qsl.net/k5bcq/sb104/sb104.html you can find a great Adobe Acrobat schematic of the SB-104A that includes a solid state LMO schematic including the plug pinout. I have a separate JPEG of the LMO clipped from this schematic if you have trouble. Whole schematic is 1.45 MB. JPEG is 640kB.

Hope that helps.

I think he has a description of the setup on there some where. It's
not a simple PC hooked to the internet, but as I recall, quite
elaborate.

Having my own domain and web site, which is nothing on the scale of
Ken's, I can vouch, it is not an inexpensive hobby.

Oh! It's busy at 2:00 AM, 3:00 AM, ... Only time I haven't tried is
the 5 to 8 AM slot.

Try Parts Express. You'll need to get them the dimensions of the belt but
they are very good about stocking myriad sizes.

I have a Drake TR4C Transceiver for sale. This one looks
good but the chassis needs a good cleaning/polishing. It is made of sheet
metal vs. copper.
The rig is complete including the original manual. It has been stored for
years. I hooked it up to a AC-4 Power Supply and got a loud hum from the
speaker. I made no further checks. This gear would make a nice keeper with a
little work. I can send digital pictures. Price is $150 for the TR4C only.
Thanks, Charlie Hugg, K5MBX

Hi Rob..
Thanks. I went ahead and got a copy of the SB101 tech and made a
copy of the schematic. I will now redraw the schematic into Protel and
attempt to come up with the resistor/capacitor values and include those
into the schematic. After that I will attempt to come up with an
alignment procedure that will, hopefully, usable to the heathkit nuts..
Look for the schematic to be posted at BAMA in the future..

Jim

By the way..
The SB104 used a less expensive LMO due to the fact that there was
no need for a linear tuning characteristic. This is because having a
digital readout meant that it wasn't necessary..

Here's the message text:

============ SCAM text ===

From member: oaks54

Hi,
I saw you bidding on a SX-88/HT-32A: HALLICRAFTERS FINEST STATION and
decided to
send this email since I too sell these. I'm a member
of the eBay community and have very good feedbacks.

If you get outbid
on the auction you're bidding on, I will agree
to sell to you for around close to your bid price if
the amount is fair. I will also throw in several brand
new games for absolutely free so I'll ensure that you
are 100% satisfied while purchasing from me.

I have not even opened any of these the boxes at all.
If by any chance you are not satisfied, I am more than
willing to give you a full refund back. I need the
money really quickly cause of some bills that I have
which are to be settled, so let me know if you'd like
to purchase this item.

I am not set up to take credit card payments but you
could use your credit card online on
www.westernunion.com to make payment or through
1-800-CALLCASH Toll Free Number. You could also make
payment with cash through a Western Union Agent Near
you if you don't wish to use a credit
card. In either ways I am willing to bear the fees.

Soo if you are interested you can contact me only at this email adress:
webmaster@adtech-electronics.com
Best Regards.

============ End SCAM text ===

Non-hams might not appreciate what happened. The SX-88 is a 50 year
old, extremely valuable, collectable radio. A couple hundred exist,
sells for $5,000 and up.

I saw it on the block at about $600 and put a token $900 bid on it.
Of course, I was immediately outbid. If I had won it, I could have
"flipped" the radio and made substantial profit.

He says, "I too sell these." I don't think so.

I was so disgusted with the poor stability and linearity in my SB104's VFO that I designed a simple VCO that used a 10T pot as the drive. It was more stable, quieter, and easier to tune than the original... I wonder what I did with those schematics?

I am in middle of making Digi-Key order and was hunting for a suitable replacment for those notorious sprague black beauties. I've searched Google, but a replacement hasn't been mentioned in the posts I've been through.

I would prefer a tubular axial leaded part of similar dimensions, but of course will take what I can get. I suppose any film cap nowadays would work ok.

any help would be appreciated.

Digikey is not real good for higher voltage axial caps. May I suggest
http://www.justradios.com
Any style will work just fine...be sure to match the voltage or go
higher. I stick with 630 volt ones just to simplify my 'inventory'.
As for size, you'll not find anything near as BIG as the BBs although
the Sprague-Vishay Orange Drops (www.mouser.com) are quite portly.

73. SX-101a Operational Questions

Newsgroup: rec.radio.amateur.boatanchors
Date: 2004-01-04 01:35:41 UTC
From: geojunkie@aol.com
Message-ID: <f2c44646.0401031735.4df2ad39@posting.google.com>
Source record: 26684

This SX-101a is my first HAM-only receiver, and has some features new to me such as a product detector. I have spent many hours recapping and aligning it, and pretty much all is well, but I have questions about what is "normal" for this unit:

For AM reception you must listen to either the upper or lower sideband, unlike my SX-71. I notice that no matter where the selectivity is set (2,3 or 5 khz) that I must retune when switching between sidebands. It is like the spread of the side band oscillator crystals is a bit wider that the selectivity. I must tune lower up a bit or upper down. Is this normal? If not, how can I close this gap a bit?

I notice that the S/N ratio seems poor. There is always a lot of background rush (kinda like white noise) compared to the SX-71. The alignment process makes no reference as to what is normal. Even with antenna terminals shorted there is still some noise, not insignificant. How can I measure to see if this is within spec, and if not, what might be the culprits?

I could not get 15 meter band to align... no matter how slug and trimmer were adjusted I could not get the full bandspread as shown on the dial. All other bands were fine. What might I look for to correct this? I set 21.3mhz right on but both ends come up short of dial setting.

BTW, for now my antenna is a 10ft wire, but that is what I was using on the SX-71 which is my only comparison reference. Perhaps the 101 needs more antenna to sound good??? Any and all advice appreciated as always.

Dan

Bob,

Mouser (www.mouser.com) sells a lot of different style caps. They have started selling Vishay 192P series caps (check out page 440 of catalog number 615). While they are smaller than the black beauties (and orange), they are axial lead caps. Sure are easier to install than the good old orange drops. I like ODs, but those radial leads sure can be a pain sometimes.

73,

Barry - N4BUQ

I received a Hallicrafters SX-71 receiver from a SK estate. It is intact and I bought a manual for it. It appears that the former owner was in the process of working on of the IF transformers, so I will have to figure out what was going on there. I haven't seen much conversation on this model on the reflector, so I would like to know everyone's opinions who know anything about it.

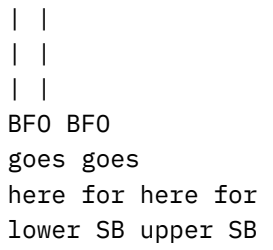
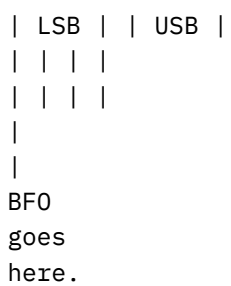
I don't know about that particular receiver, but keep in mind that
except for one or two ham receivers (and some expensive professional
receivers), the BFO always moves when changing sidebands. There is
only one filter so the BFO has to move from one side of that filter
to the other.



The BFO is places so the suppressed carrier lies on the slope of
the filter, and the whole of the sideband fits into the filter with
the unwanted sideband being out of the picture.

The exceptions I mention have two filters, one for upper sideband and the
other for lower sideband, and the BFO is the common point between them:



In this case, it works the same, but since there are two filters
the BFO stays on the same frequency while the filters are switched.
Not too common, since it's costly to have that extra filter.

Anyway, when you shift the BFO in the first case, you need to retune to get the "suppressed carrier" of the incoming signal to that spot. I'm too lazy at the moment to come up with some examples, but think about the incoming signal. You get a certain beat note on that signal. But if you shift the BFO, it and the incoming signal can no longer cause the same beat note. You are retuning so the incoming signal is once again on that curve of the filter, on the same side as the BFO is now at.

That was the way of the early SSB receivers. With time, tricks came into design play to compensate. One involves an additional conversion, and I'm too lazy to try to explain it here. Besides, the most common scheme is simply to add a bit of shift to the local oscillator so the retuning is done automatically. So with any recent receiver, say the past thirty years or so (at least decent receivers) one will not notice the effect you mention. Even with older receivers this gimmick was in place, but I'm not sure at what point one could say it was common.

New Year greetings to all.

In order to carry out some alignment work on my AR88 (obligatory glowbug/boatanchor content),I am trying to locate any details of a Texscan
Log Detector Type LN-40A to go with my Texscan VS-30 sweeper.Can anyone help with information/detail?

Thanks,Brian Goldsmith.

The SX-101a has two crystal controlled oscillators (selectable one at a time for upper or lower sideband) for mixing the first IF signal down to the second IF frequency. The BFO is deactivated during AM mode. So what I am saying is that even at the widest selectivity setting, switching between sidebands on AM mode requires retuning, as if the two crystals have too wide a gap between them. I am going to try and check them, but the output is probably way too low for my counter (needs 100mv min).

"I haven't seen much conversation on this model on the reflector, so I would like to know everyone's opinions who know anything about it."

I just recapped and aligned one, and I find it to have excellent fidelity on AM, and also very useable for SSB using the BFO, although you have to manually reset it for the upper or lower SB. With the two tuning dials (main and bandspread), it is not as easy to be precise for finding an "exact" frequency, but it is just fine for roaming the waves. Being general coverage it is also a good SWL receiver, which is surely what it was marketed for. I think this was Hallicrafters first double conversion unit. The crystal filter is useful to reduce QRM, but adds some sonic "hollow sounding" effects. I like this unit.

Eddystone 770U UHF (150 - 500 MHz) tube receiver. Looks nice, very clean, works fine but "may" need minor tweaking. A few minor scratches and plastic caps missing on three push terminal connectors on rear but no serious issues.

$300 plus shipping or pick-up. Pics available. These aren't seen often in the States and especially not in this nice condition. Shipping wouldn't be inexpensive as it weighs almost as much as my R-390A.

From: Wayne and Louise <wirwin2@cfl.rr.com>
Message-ID: <R44Kb.114276$Dt6.3324034@twister.tampabay.rr.com>
Source record: 26564

It was actually marketed as a communications receiver with a target to the amateur market. It was new in the early fifties. I bought one used in 1965 for something like $50.00. Had it for years and used it as part of my first station. I let it go to a rehabilitaion hospital that wanted it for use by patients who were to be lifelong residents of the institution. I found another one just a few years back but had to pay $75.00 this time. It is a good receiver for its age. Most equipment of this era usually will work better with a systematic replacemant of the old paper/wax capacitors with moder equivalents. If the object is to keep it authetic, you can even put modern capacitors in the original cardboard tubes. There are a couple sites showing how to do this with very respectable results.

I also ran into an article on how to soup up the receiver by changing the cathode bias and the screen resistor of the second IF so that it would be the same as the first and third IF. I haven't tried it yet, but I will one of these days. The author of the article, Phil Atchley, KO6BB claims that AGC action, especially on the higher bands is improved.

Hope this is of value to somebody.

Hello, Wayne. I live a few miles away, near Belleview. I'm about a
mile from 441 and the Belleview Santos elementary school. I worked at
microdyne till they started to close it down in 2001. I collect and
restore old ham receivers, test equipment and other oddball electronics
and books. I am working on a National NC-183R, and a TS-382 signal
generator right now.

>
Do the signals really jump out of the backround noiise, or does it seem like the radio is half deaf? I don't know the SX-101, but in general, a very sensitive radio might very well have a significant amount of backround noise. Of course, if the sensitivity seems low, you will have to do some basic troubleshooting. The RF amp and the mixer are the main suspects.

Be sure you didn't miswire anything when you recapped it. I'd like to say such things never happen, but I miswired a ratio detector after I fixed a bad connection at it's internal mica cap a couple of days ago.

> I could not get 15 meter band to align... no matter how slug and

The oscillator may be on the wrong side of the signal. If it's above the signal, try setting it below the signal. Or vice versa. Don't expect the oscillator to be on the same side of the signal as the other bands.

>BTW, for now my antenna is a 10ft wire, but that is what I was using

> always.
>
> Dan

Again, I don't know the 101, but I'd expect it to be considerably more
more sensitive than the run of the mill Hallicrafters radios such as the
S40A, which will start to work with a clip lead on the antenna terminal.

It gets this from having a heavy plate that can store a lot of heat in
it, so that it can deal with very high heat generation for a short period
of time.

If you're operating anything other than pulse service, it's basically
equivalent to the 6146, although I suspect it's probably worth more money
if you can find someone out there who is running something using it in
pulse mode. I know these were used for modulating some magnetrons for radar
service.

Source record: 26575

I have 2 TMC (Technical Material Corp) "strip" receivers for sale. See spec sheet at:
http://www.geocities.com/vintagetmc/str5-1.html

Please note that clicking on "next" at bottom of the page brings up 2nd page.

Modules contain crystal overs and demodulators, and are in 5-10 Mhz range. No power cords or manuals. Interesting cold war stuff, as "war time" modules with demodulators were kept in sealed containers for secrecy reasons.
Both for $300 Will not sell individually. Shipping extra.

I also ran into this article, but on my receiver, which is a later model, I could not see clearly what he meant. Perhaps the design changed in the later versions, because it seems to have plenty of gain to me. If you happen to figure this out let us know.

Dan

I did quite a bit of A/B listening between the two on Sunday. The
SX-71 seems 3-5db quieter. The fidelity on AM also seems better,
perhaps because it uses both sidebands? The Sx-101 is clearly superior
on SSB, although if you tweak and tune the Sx-71 does pretty well
there also. The 101 is far easier to discriminate adjacent channels
with in the crowded areas of the band and it has tons of gain left at
the same volume settings. However, I don't think the gain is useable
because the noise floor goes up with the gain settings. The 71 is
double conversion also, so either it must not be too shabby or I don't
have the 101 running right yet.

AT THE RISK OF PISSING OFF BILL...

Turned off my BA rigs tonight and downloaded some pics from the NASA MARS Spirit Rover Website.

I started playing with them on my computer just for fun by enhancing and colorizing them and the result just blew me away.

The results are MUCH better than what NASA has on their website.

- these blow NASA's orginals right out of the water !!!

You will need those funky Blue/Red 3-D glasses to enjoy the effect.

I also have the NASA originals so you can compare NASA's to mine.

I posted the first Mars 3-d PANO (Panoramic).

http://users.ev1.net/~wd0hco/

Since hams INVENTED slo-scan TV as well as other technologies used by NASA - seems only fair for hams to show them the way... again.

Enjoy - Biz

The NASA website is :

http://marsrovers.jpl.nasa.gov/home/index.html

We now return you to those flickering filaments.....

I've seen some of what you're referring to. I don't always agree with Bill either. He and I even locked horns way back when when I used a different name. But the example Tracy used in his retort, I think could have been left out. Doing a "good" deed to help a homeless person is not something to be mocked. He may be in the same predicament some day and be thankful for someone's like actions. As for other razzing, I see many people razzing Bill. I guess what really caught me off guard was that Bill and Tracy were going at it in Rec Radio Antiques and I "thought" they had called a truce... Then I seen this. And it DID appear that Tracy had misread the post Bill made, whether "anyone" agrees with it or not and posted in that manner. I don't know Bill NOR Tracy. I was just posting what seemed apparent. Actually, this whole damned thread - even my own replies don't belong here. Hopefully, we can get back to regular scheduled programming. I'm sure we all have better posts to make that will be of benefit to all. G.W.

My retort was an implication that Bill was doing something to gain
something. In other words "What's in it for Bill"? I've never been in
an argument with Bill other than a little spat here and there. My
argument was with someone else and a truce was called to keep it from
going on forever. If you go back to rec.radio you will see that Bill
did not mean to make this post to this group. That, I thought was
funny. If I'm ever in the same predicament as Bill's homeless buddy, I
sure hope he is not the guy to help me out. I don't think I want to
spend the rest of my life trying to pay him back!

Well, that is cool with me. I did miss part of that you mentioned. But I DID see the truce part of it. You are entitled to your opinion. We both expressed them as did others, I believe - and it didn't even get into a shouting match - which is nice. I'm sure we can all find better things to post about that would benefit the majority. By the way, HAPPY NEW YEAR. Let's start it off a bit better. I hold no ill will towards anyone. G.W.

133. superhet alignment ?

Newsgroup: rec.radio.amateur.boatanchors
Date: 2004-01-06 21:24:19 UTC
From: Henry Kolesnik <wd5jfr@oklahoma.net>
Message-ID: <vvm9s63rd674c3@corp.supernews.com>
Source record: 26494
Cross-posted to: rec.radio.amateur.homebrew,rec.radio.amateur.boatanchors

I think it was after last summer that I saw a published magazine article where someone had come with a new way, at least for me, to align a radio so that the dial would be calibrated throughout its range. IIRC he set the trimmer, padder and other adjustments just once or maybe twice. In the past I have set and reset all adjustments several times, each time cutting the error in half until I'm satisfied or worn out.. If anyone recalls the article I sure would appreciate knowing. It seems like it may have been Monitoring Times or Popular Communications, neither of which I subscribe to, but it could have been elsewhere, because my memeory isn't as good as it was because I was taking Lipitor, and have now quit.

Why would someone that obviously knows about radios and collects them make a bullshit statement like this? Everybody knows the SX-28 was one of the most mass produced receivers of that era and are still plentiful. It pisses me off when people that claim to be collector or lover of the radio hobby exaggerate or lie to make an extra buck on a radio. Yes I'm speaking of a certain place people auction radios. People like this won't get my buck.

Why don't you spam the group with your auction a few more times, someone might have missed it. Be sure and spam the group again just before it ends, you might get another doller for it, however it is obviously overpriced as there are no bids yet.

Ebay sellers are greatly known for the abuse of the words "scarce", and
"rare". After all if they use those words it might get another bid or
two, makes no difference that they have done no research or have any
other information to base it on. The idea is to get another buck.

No. Not for a fully restored example. $650 barely pays for the work involved
in a fully restored SX-28.

You don't understand! They mean that it would be rare, or scarce to
find a collector who doesn't already have one.

Subject: Question for seller -- Item #3069232937
Date: Tue, 06 Jan 2004 08:21:13 PST

Hello,

My name is Danny Porini and i am from London,England.
I have for sale a SX-88/HT-32A: HALLICRAFTERS FINEST STATION
.This is like new in original box with all accesories.
I want USD for 3200 a piece.I can get 3 pieces.
If you buy them all i will make a 20 % discount from the total price.
Shipping and assurence is free.Fast shipping via UPS eXpress Air.
Payment is made via Western Union wire transfer or direct bank
account.

Thanks nand have a nice day!

Question from: dannnnyyyy_6
Title of item: SX-88/HT-32A: HALLICRAFTERS FINEST STATION
Seller: xxxxx
Starts: Jan-01-04 19:00:00 PST
Ends: Jan-11-04 19:00:00 PST
Price: Currently $4,400.00
To view the item, go to:

Visit eBay, The World's Online Marketplace TM at http://www.ebay.com

=============== End Snip ==

So a new scammer Porini claims to have THREE SX-88's, like new in the
original box???? If I buy all THREE SX-88's and HT-32A's, he'll give
me a 20% discount.

I doubt it.

Where do we get these idiots from, Nigeria?

But suppose they said that they had 3 IC-746's, new in box and needed quick cash to pay ICOM for that new radio. That might be almost believeable. The danger is these scammers are getting smarter.

I don't have the money for something like an SX-88, most folk don't.

By the way, I fired up the SX-100. It is fantastic!!! It needs work but that'll be some fun next winter. Everyone should have one, old style, band cruiser tube radio. Hammarlund, Hallicrafters, whatever. Just so it has a big analog dial, a flywheel knob driving a meshing capacitor, and a nice, loud, tube audio. The NC-270 is a good choice too.

Guys, these are still cheap.

keep in mind about 70% of all ebay sellers are WOMEN! They dont have a clue about some things, notably radios, and , are more likely to just say whatever they feel.... based in fact or not. To them, or any guy who is not seriously into radio, that is a RARE radio! And, in fact, you could go to about 2000 garage sales and not find one...which is their basis for reality. so, cut these folks some slack. We are into this stuff DEEP, so to us its common. Well, not exactly common, anymore, anyway. I go to about 8 swaps a year, most antique radio , some ham, and I have not seen one in the last year or so for sale...so, its not as common as you think. but, like I said, consider the sellers are not as "into" this as we are, and yeah, they are hoping to get the best $ they can, who isnt? Not you? I bet you always try to make your items sound good when (or if) you ever sell. We all do, its natural.
But, I dont lie... and, saying its "rare" is technically a lie, but like I said, in their world it is... and, in ours, its becoming true too....except if you look at all the other SX-28's on eBay... and, how many are there?

From: nospam_deepsea_77@yahoo.com
Message-ID: <3ffbaaa5.7446798@nntp>
Source record: 26516

The manual is rather sparse on this, and I was wondering if anyone out there has any hints or kinks that will aid in neutralizing the Apache TX-1 final stage. A brief description of the process would be great, as the manual doesn't seem to directly address it.

Also, the previous owner seems to have doped (red colored) the final ceramic tube sockets and the solder lugs, and capacitor leads; Good idea? (The dope seems to be flaking/failing in some places.)

Thanks to the group,

Lin/KJ6EF
For email responses, remove "nospam_".

Message-ID: <88OKb.182360$ss5.164147@clgrps13>
Source record: 26515

The procedure to neutralize an amp is pretty universal.

The purpose is to cancel the feedthrough RF from the driver via the Cg-p
capacitance.

Disengage the B+ to the PA (plate and screen for tetrodes/pentodes),
but keep the plate tank connected.

Transmit into a dummy load with power meter inline.

Adjust neutralization cap until tuning the plate tank circuit through its
range causes absolute minimal or no output.

Unit is now neutralized and B+ can be reconnected to the PA and you are
ready to rock!

We also have Ken Bass, as in the song line, "Oh my buddy Ken Bass, he's a-workin' pumping gas, and he makes $2.54 an hour" ("Gold" by John Stewart, from the "Bombs Away Dream Babies" LP). Plus we have a traffic reporter with maybe a dozen names, one for every station he serves. He has a woman named "Claire Day" working for him. There also was once a hard rock DJ, Dave "your radio slave" Stone, "Bad" Bob Lee, "Emporer" Larry Lomax, "Jammin'" Jeff Allen, "Captain" Mike Kasper and an Australian student named "the Wombat" who left on visa issues (he was pretty damned good and likeable too). All in Boise radio.

Once you get it as close as you can, you can bend the plates of the
air variable. This will align it in little band segments. Remember,
the slug will align the low end of the band, then you can use the
trimmer to touch up the high end, without much effect on the low end.
Also, on older equipment, Ive found that sometimes you cant get enough
induction out of the slug/coil. I think the slugs lose density over
time, so you may end up rewinding the coil with a few more turns of
wire.

Hi All,
I just thought I'd mention that there is a rather rare D cell
adapter for the BC-611 series on eBay right now. This is the filament
battery adapter (military designation is FT-501) which subs 2 D cells
for the hard to get filament battery in this radio. The item # is
2216017085 .

You can't do it with a power meter with the hv disconnected. You would need an rf voltmeter to see the output. Or a scope.

But the easiest way is to leave all voltages on. Tune up into a dummy load to proper power. Then watch the grid current as you tune the plate tuning of the final. Grid current should peak slightly at exactly the dip in plate current. You should also get a peak in output at the same point. If not adjust the neutralization cap slightly. Do this on 10 meters.

An increase in grid current on low frequency side of plate resonance indicates neutralizing cap is too big. An increase in grid current on the high side of plate resonance indicates the neutralizing cap is too small.

As you get closer to proper neutralization you will see less of a change in grid current as you tune the plate through resonance and it will be smooth.

You may not be able to get everything to exactly coincide but you should get close.

You will not be able to see the output using a power meter when disabling the plate and screen voltage. An rf voltmeter or scope will work.

Do this on 10 meters.
The easiest way to neutralize the final is by leaving all voltages on. Tune up as normal into a dummy load.
Now as you tune the plate tuning control watch to see if you get a dip in the plate current at exactly the same point that you get a slight peak in the screen current. You should also get maximum power out at the exact same point.
If not the neutralization cap needs to be adjusted. Adjust in small steps and retry for the above.

If the grid current goes up when you tune the plate tuning to the high side of resonance the neutralizing capacitance is too small.

If the grid current goes up when you tune the plate tuning to the low side of resonance the neutralizing capacitance is too large.

When you get done the grid current rise should be smooth with less increase than before and at exactly the dip in plate current. Also the power output should peak at the same point.

You may not be able to get it exact but it will be ok if you get close to that.

When properly neutralized you may find that you have less apparent grid drive available. This is because the feed back before was enhancing the grid drive.

I have for sale a Hallicrafters R-47 Speaker. This speaker works great. It has a nice front grill and panel. The top has some spots in the paint. Could be touched up. Price is $45. Thanks, Charlie Hugg, K5MBX
Hallicrafters began production of this compact and handsomely styled speaker in 1959. It was especially designed for superior SSB and other voice applications. It has essentially flat response from 300 to 2850 c.p.s., drops off rapidly in output beyond cut off points. Its input impedence is 3.3 ohms. It is a perfect match for the currently produced Hallicrafters SX-99, SX-100 and SX-101 and many later models. It is 5 1/2 X 5 1/4 X 3 1/2 inches and weighs 2.5 pounds

I have a Drake TR4C Transceiver for sale. The front panel and cabinet look great, but the chassis needs a good cleaning/polishing. It is made of sheet metal vs. copper. The rig is complete including the original manual. It has been stored for years. I hooked it up to a AC-4 Power Supply and got a loud hum from the a speaker. I made no further checks.Not sure whether it was the PS or Rig causing the hum. This gear would make a nice keeper with little work. I can send digital pictures. Price is $135 for the TR4C only. Plus shipping form 79602 Thanks, Charlie Hugg, K5MBX

I have only a wild guess. Any 2M converter I ever diddled with, converted to 10M. You might try testing it to 28 - 30 MHz and see what happens. My guess is that it might tune 145 - 147 MHz.

It was pretty common to convert to 14MHz also, and I might tip things in
favor of 20 meter output being more common, at least for much of the tube
era.

But matching converters were not all that common. Usually, one bought a
converter from a third party, that often specialized in converters. At
least until SSB came along, at which point some manufacturers added
transverters to their lines. Hallicrafters had such a thing, in
the form of the HA-6 (six meter transverter) and the HA-2 (for two
meters). I can't quite place Hallicrafters making receiver converters,
but then at the moment I can't even place the SX-101 (but if a year
was offered up, I'd check some old magazines).

The on receiver from that era that had matching converters was the
National NC300 and/or NC303. It had a an extra dial for converters, and
it actually tuned an extra 4 MHz, 30 to 34 or so if I recall properly.
The oddball IF range almost required that National sell converters to
go with the receiver.

The HA-2 is a 2 meter transverter - converts to 10 meters.

There was also an HA-6 6 meter transverter.

The Hallicrafters website has a catalog link, the 1963 catalog on the last page has it pictured. You probobly noticed that the later SX101A's had no 160 meter band, but an auxilary converter band for these new products. Also the Boatanchor manual site has the manual. link below.

http://bama.sbc.edu/

Have fun - George N3DRX

I have a very interesting PPI display/indicator found recently in a surplus shop.
They said was the PPI display of the legendary Phantom F-4
Anybody in BAland has schematics or pin list of the rear connectors?
Regards

Claudio

Being "rare" isn't significant to me. A rare radio implies that they
didn't sell too
well, because of bad style, engineering, or just too expensive for what
it did.
I have a web page showing the "common" easily found radios that I own.
http://www.geocities.com/wa2ise/radios/common.html

I like my radios "well done" :-)

Problem is, I don't have an SX-101MK3 anymore, so there's nothing to hook this up to, not to mention the fact that the tubes are missing, so I suspect it has a problem.
Hallicrafters ads state that 6 & 2 meter converters (not transverters, so the HA-2 isn't it) are available & the dial is calibrated for these bands. Other than that, I can't as yet find any info.

Did the receiver have much of a lifespan? I just checked my QSTs and
CQs from around that time (admittedly the collection is incomplete), and
I found no ads for it. A lot of trasmitter ads, the other receivers
got full ads, but about the only thing I found was in the April 1959
issue of CQ, where it's shown as part of a station, with no details.
I did find an ad for the SX100, but I have no idea how close it was
in design to the SX101, and certainly no word on converters.

From a fairly small image of the SX101, it looks like there are only
six bands? At least I can only count six levels on the sliderule dial.
That sure does not suggest a special band for the converters.

Of note, the ads for the HA6 and HA2 mention a 10 meter IF, so perhaps
that is a good guess for the Hallicrafter converter, if it is indeed
made by Hallicrafters.

It should be easy to check. Look at the crystal frequency. A 43.333MHz
crystal was common for a 2meter converter that converted to 14MHz.
I'm less certain of what the common frequency for 28MHz IFs were,
but maybe 58MHz or 38.666MHz. A 116MHz mixer injection was pretty
much standard for a 10meter IF, so the crystal would usually be half
or a third of that frequency.

I have an Exceptionally Nice Hallicrafters R-46 Speaker for sale. This is
the 500 ohm version. It is deeper than the R-46A,
but looks similar. For a picture of this exact speaker and more information
about it, go to my webpage at:
http://hug-a-bug.com/R-46.html
Price is $95 and I will split shipping. If you have been looking for one of
these speakers, I don't think that you will find a nicer one. Thanks,
Charlie Hugg, K5MBX

The SX-101 was in all the magazine ads. There was a marketing campaign such as the world has not seen since. Well, maybe Brittney Spears comes close.

I think Hallicrafters worked the same way. 30-34. Nothing oddball about it. As most receivers covered 28-30, it was an crystal swap to get it working with anything.

Well, sellers sometimes like to say a mass produced item is rare, not
because it didn't fit a market or wasn't a good deal for the money, but
because "it probably was ahead of it's time:".

Hello-
Manson Labs synthesizer pair { used to operate a pair of R-1247
R-390A's}is available. These synthesizers are very rare and I have heard of
only several others out there.{ serial #'s are low, # 46 and # 71 on this
pair} The system they were part of is the GRC-129, consisted of modified
T-368 for SSB, pair of R-1247's { modified R-390A's by Manson Labs with osc.
switching relays}, SSB receiving converter, and auxiallary items.
This synthesizer provided for the tuning of receiver { substituted for
PTO}and has a mechanical digital counter {as on the receiver}.Other osc.
frequencies are provided by synthesizer { by "MC. CHANGE" switch on it, plus
17 MC. and 455 KC.
Units are in nice cond. and have not been powered up.I cannot locate any
technical data.
Here is a link for pictures of the Manson Labs
synthesizer pair.
http://edebris.com/catalog2/item/1061

I prefer to trade them for a late model 1967 EAC in excellant cond.or
will sell for 750 USD.
Here is some info on the 2 units comprising the
Manson Labs synthesizer pair.They operate together.

Regarding the Synthesizer, Electrical Freq. serial #71
O-1203 / GRC129 Manson Labs { Rack mount, about 4" tall}

Front Panel has : Power Switch
KC. Change crank knob and 1 KC. Change
smaller knob, mech. coupled in set. { Turning 1 KC. change smaller knob will
step KC change large knob in 1 KC. steps}
4 digit mech counter, about 1-1/3 size
of R-390A
10 KC. Test push button and zero adj.
pot knob
Synth. Level pot knob
Meter Selector 8 position knob
Test meter is " 0-5-0 " scale, round
about 1-3/8" OD
Rear Panel has : 2.455 to 3.455 MC. Output pair of BNC conn.
100 KC. Input BNC conn.
115 VAC 60 CPS power input Amphenol 3
pin conn.
Terminal strip with 4 term. labeled "
GND- FIL.- FIL.- B+"
Stamped " Unit 9" in white lettering

Regarding the Converter,Frequency,Electronic serial # 46
CV-1693 / GRC129 { Rack mount, about 5" tall}

Front panel has : MC. Change knob 0-31
3 Loop Warning lights
Test Meter " 5- 0 -5"
Meter Selecror switch
Power Switch
Has fan grill / filter in
front center

Rear Panel has : Power Input 115VAC 60 CPS Amphenol
Qty. of 8 BNC conn. as
follows -
2 are" 9 to 17 MC.
Output"
2 are " 17 MC.
Output"
1 is " 455 KC.
Output "
1 is " 100 KC.
Output"
1 is "100 KC. Input
"
1 is " 100 KC. To
Synth. "
Stamped " Unit 10"
in white lettering

I bought this many years ago, it is on a wood base, with a pre-amp and coil which could be removed to change freq coverage. 3 coils included. . Uses 9v battery, RCA jack for output. Ferrites are multiple and long (22"). Comes with 3 coils . Has plastic azimuth on base to show direction, and of course tilts to null out certain skywaves. It did not work when I got it; I've lost instructions, and am selling as is. This was a semi-commercial product, not to standard of Palomar or Kiwa, but obviously made in small lots. Since it came from AM-DXer, one of the coils is proably AM. Will pack carefully. $85 plus shipping. Paypal.

One company involved in aircraft radio, and later more strongly in measurement receivers, was Stoddart Aircraft Radio. Take a look at http://online.sfsu.edu/~hl/src.html and also do a search on Hughes around the world flight in late 1930's.

I have restored several receivers, but this is my first transmitter. It seems to be nearly 100% original... paper caps and all. It was reported to have been regularly used up until last summer by the previous 30 year owner. I assume that I should go ahead and replace the paper caps, check the resistors, and check/replace the electrolytics as I have been for receivers... correct me if I am wrong. Is there anything else that usually needs to be done/inspected for a transmitter? I have no way of testing the 4-400 outputs or the 3B28 rectifiers, so do I just fire it up and hope for the best? I assume I should try and bring this up with a variac, but would really appreciate a startup procedure recommendation for high power vintage transmitters.

What a beast. Lifting the power supply will make your eyes water. This has the largest transformer and tubes I have run across to date. Can't wait to see what those 4-400s look like lit up.

Source record: 26484

According to Fred Osterman in his book "Shortwave Receivers past and present", SX-101s & following models were produced from 1956 to 1963. In the description, he says that the dial is precalibrated for a 2 or 6 meter converter on the later "A" variant only. It had a freq range of 10-80 meters plus 30-34mhz.

Chuck WG2A

After you replace the caps and bring the voltage up slowly with a
variac, you still shouldn't transmit unless you have a known good,
known low-SWR antenna.

Having an antenna or even better, a Heath cantenna, you can tell if
it is transmitting with a power meter and your receiver. The
receiver will tell you the frequency and a power meter will show you
that the controls are working properly, load, tune, drive, etc.

That much power will quickly warm up a cantenna.

Parasitics are self oscillating finals. If that happens, the plates
of the tubes will glow red when you apply HV but are not talking
into the mike or are key-up. Watch for this and be ready to cut
the power.

Unless you have solid state rectifiers installed, don't waste time bringing
it
up on a variac, especially if it has only been 7 or 8 months since it was
last
used. I would replace any paper caps though. If you have a dc bench
power supply, you can reform the electrolytics in circuit just as a
precautionary
measure.

All the other advice....dummy load, watch for parasitics, etc. was very
good.....
Check the bias voltages on the finals and then watch the plate current when
you
first turn on the HV. The manual should give you the resting plate current.

good luck & 73,
Phil
W5BVB

a dc bench power suppy just to be sure.

You're asking a VERY big question, Ralph.
"Aircraft radio" from just 1940 to 1945 would literally fill volumes.
Is there a specific area of information that you need?

Hi Ralph,
I have the actual radio and the service manual about it for a 1948 Stinson. The radio is a Hallicraftafters Skyphone CA-2. It was not originally in the Stinson my wife and I owned. I wish I still had the Stinson 9308K but it is currently in Alaska. It was stolen from Mt. Hawley Airport in Peoria, Illinois when my wife and I owned it. It was found near Red Wing Minnesota before we knew it was gone. Someone took it somewhere around 4:00 Am from Mt. Hawley airport in Peoria and made a dead stick landing near Red Wing about 07:00 am. He got a ride into town and went to the local bar for a ?? After awhile he said well I better get back to my airplane and walked out the door. His finger prints were all over the Stinson but after comparing them to mine and my wife's they never showed up in any of the Feds files. Since an airplane is a Federally registered vehicle if one is stolen the FBI gets involved. Well they didn't give a rat's ass about who took it but where concerned about why they wanted to leave the Peoria area so quick or why they wanted to get to the Twin Cities so fast. The only hope my wife and I have is some sucker on his death bed will go" do you know what I took from Mt. Hawley Airport in the past?? It was a great airplane and my wife was the only one that went for a ride in a bean field with it duringa ground loop! Sorry to digress from the topic at hand but if you ever need a manual for a CA-2 or a CA-4 let me know!

Hi Ed,
I guess I should have said when we owned the Stinson it was stolen. After we got it back we sold it a couple of years later to someone in the Chicago area. A couple of years ago I looked up it's "N" number and it is now registered in Alaska.
Sorry for the confusion!

Cherry SX-28s are scarce. Especially ones with the dial locks, no rust, no dust, no mods... Them seem to prefer damp cellars and garages in later life. I have two garage rats that need full restoration--awaiting my retirement time in a few years. They also seem to bunch with with SX-42s, another two locally found items that also liked dark places. Must be a mating thing?

The obvious reason for claiming anything "rare" is to increase the selling price. Rare suggests hard to get, not found in every collection- thereby invoking supply/demand dynamics. Case in point: I have a Zenith tabletop, model 5G537. It uses chassis 5A02, the same as console 5G572. According to Zenith records, only 4000 chassis were built. An unknown number were put in tabletops compared to consoles. In the big scheme of things for Zenith, this model is rare. Can I legitimately advertise it as rare? Sure. Compared to other chassis like 6B03 found in 224,000 portables (like 6G601 variants). Does that make my 5G537 worth $500? Probably not. But at least I can PROVE rarity based on facts, not on a hope, guess, limited experience, or dream.

most folks get rarity and desirability confused.
Rarity is component of desireability, not the other way around! Same with
age, condition, etc.

About bringing the TX up on a variac, IIRC 3B28's are xenon gas
rectifiers and may not strike until the voltage across them is high
enough.

Yeah, rarity and desirability are hardly the same thing. If the practical people of the past wanted to pay for, or keep, any mass produced items -- they would not now be rare!!

Of course, collecting isn't practical, it's emotional. I have several old radios, mostly boatanchors. They all still work as well as they did about 50 years ago. I'm sure the many people who made these radios common thought they were a good deal for the money. I'm also sure the original boxes and packing materials would now be worth more than the radios they once contained.

Hi All

I do repairs on specializing on the Kenwood 930 / 940 radios and Yaesu FT-102. Complete rebuilds from top to bottom, PLL repair and power supply rebuilds & updates, All fix's and modification also. I have over 6 + years experience with these radios. Completely satisfied customers & many reference's..... Have extra parts too...Very reasonable rates, fast turn around time. I also do custom modification for audio... Work on other Kenwood & Yaesu models Too !!

Get that 930 / 940 back on the air !!

If you need a repair or anything done give me an email

thanks John, KI4NR

Well, let's put it another way: suppose you took a load of junk to a
junkyard for disposal, and while there saw a complete SX-28 at the
junkyard in fair-to-midllin' condition, located directly below a sign
that said ABSOLUTELY NO SCAVENGING ALLOWED, would you pass it by, or
would it magically wind up in your car or truck somehow with a blanket
over it?

Scarce or not, I know what I would do.....some rules were meant to be
broken :-)

The SX-28 may not be rare in actuality, but it is rare in the sense
that not too many radios with its level of performance were built in
that era, and fewer still survive completely intact.

Yup, that's all there is...and the manual goes through a lot of
tune-up for bias level, and clipping, etc, etc, but the word
"neutralization" never appears.

Perhaps on the Apache it's not as critical as one might think.

Jackson Dynamic Conductance Type Tube Tester - Model 648

Excellent condition with built-in roll chart.
Has almost all type of tube sockets and will test
a very broad variety of tubes. This is not just an
emission tester like most tube testers.

This is a full-feature transconductance type tester.
115V AC operation, with a good power cord.
Unit is in excellent working condition.
Will sell for $99.00 plus shipping.

The old classic way was a 100KC crystal calibrator.

More modern displays sample the VFO, add in the IF and display the count.

It would be easier by far to build (or buy) your own external oscillator. This will not only work with your S-108 but with anything else you might buy down the road, and you won't have to hack holes in your radio. The basic one is just a crystal oscillator with a 100kHz crystal. Fancier ones will allow you to switch in a 1MHz crystal. I have an old Heathkit one that I hopped up by adding a divider to get marks at 100, 50 and 25kHz for aligning narrow-spread QRP receivers.

I know that any ARRL Handbook from 1930 to 1976 will have such a circuit -- I'd be mildly surprised to find out that a later one lacked it, but I'm too lazy to get up right now and check. The 100kHz crystals are still available from places like JAN Crystals and International Radio (http://www.qth.com/inrad/). You can pretty much decide what you want the thing to look like, select the appropriate date handbook and start cutting metal.

From: George <marmot@highstream.nst>
Message-ID: <1003eo2mse2or1c@corp.supernews.com>
Source record: 26428

I have some heath parts and manuals for swap:

Several HP-23A and HP-23B power supplies
SB series S-Meter (from a receiver I think 100 ohms 1 ma) GC
7 small SB type knobs GC
1 TS-830 finger hole type tuning knob GC
1 BC-348 spinner type tuning knob GC
1 original SB-102 manual fair condition
1 SB-101 manual copy unused LN

I mainly need a SB series main tuning knob and a HW-202 manual but may
swap for other boatanchor gear.

I would simply use a divide by ten oscilloscope probe
connected to the plate of the S-108 local oscillator tube, feeding
a frequency counter. The divide by ten probe provides isolation,
to avoid pulling the oscillator off frequency.

If you just want a 100 KHz calibrator, I recommend an old Bud Radio
model "FCC-90 B". It has it's own power supply, and requires
no connection to the receiver. (Just uses a loosely coupled
antenna wire near the receiver input). It has two tubes,
a 35W4 and a 50C5, in a transformerless circuit.
The older Bud model FCC-90 used octal tubes.

While all of the previous comments are good advice I suspect a counter
would drive a guy crazy on an S-108 with the constantly drifting freq
and oscillator pulling.
The 100kc calibrator will get you in the ballpark...at least to as close
as you can read the dial...I don't recall that there's a front panel
tweak to align the pointer or LO to have the calibrator line up with the
dial.
Nice little radio but if you want a better radio, well...
Its kinda like sticking STP racing stickers on a Chevy Vega.

The bandspread is marked off with a 0 - 100 interval. If the operator notes the number of bandspread divisions between known 100 kc intervals, he can come up with a reasonably precise approximation of the actual frequency. Good enough for SWLing, anyway.

No that's not true there were a lot of radios as good if not better in performance than the 28. One for instance is the Hammarlund Super Pros that were mass produced and served the same purpose and the great HROs. The looks of the SX-28 is what makes it desirable along with its great audio. That's what made them popular with Military and FCC monitors was they were less fatiguing to listen to. Its arguably the best looking boatanchor of all time too. But its not rare and its the one radio if asked to be found can be. I've restored several SX-28s and SX-28As and they always seem to find their way into my shack.

I've got one that fits the description you gave. Mine works ok (last time tried, 10 or 15 years ago). I'll get it out and see what the data plate says. (might be one or two days) I was thinking there was a schematic glued inside the case to one wall, but I'll check that too. This one I have became military surplus when bombers changed from reciprocating engines to jet engines. I think (think, I repeat) this one was used to view propellers in motion. Blade tracking and such I imagine.

Nobody has to go back that far. You can go back thirty to thirty five
years, and crystal calibrators were solid state. Not just that, but
they had a divider so you could get multiple outputs. This is
real useful for the especially ill-calibrated receiver (start witha
1 MHz output because they are easier to count), and those 25KHz outputs
were useful even for the better calibrated receivers, to find those subbands.

And realistically, once transistors and then digital ICs became available,
crystal calibrators were amongst some of the first station accessories to
be turned solid-state. And they were applied at the time to many a
real boatanchor.

To me, the SX-28 is somewhat like the Zenith TransOceanic -- a fine set of its type, yet still readily available. As a collector, it's hard to look down my nose at any combination of good performance and current affordability. I spent considerable time restoring my first SX-28. The second one, cherry by anyone's definition, is still waiting in the workshop for some winter when I can do the job right :-)

Sure, comparable or better radios were manufactured during those years, and a very few of those fall into the genuinely "rare" category (I even own one or two). IMHO, the big attraction of radios such as the SX-28 and TO is their rich history. Who listened to this set, and what was playing then? The mind wanders . . . .

Regards,

Phil N.

Not to mention images and unmodulated carriers. Actually, I never used a crystal calibrator. I'd count off the divisions between two known SW broadcasters and divide difference in frequency by the number of divisions and come up with a useful approximation. It's kind of a pain. And not so useful for the ham bands. Anyway, I haven't done it in years, and I never did it much. I mostly listen to the strong domestic SW stations now.

Those non-linear bandspread capacitor plates on the S-38 and S-53 types will introduce more errors.

Frank Dresser

Do care. The vernier tuning drive is a major failure and there's no
easy cure. The rig is a cripple otherwise.

-Bill McM

**** Remarkable!!!!!!
The OP was quite specific,"dont care about its cosmetics or working
condition",yet someone tells him,"Do care"!!!!!!
The human condition will never cease to amaze me!

Brian Goldsmith.

293. Re: SX-28 Scarce? Then what about the SX23????

Source record: 26355
Cross-posted to: rec.antiques.radio+phono,rec.radio.amateur.boatanchors

I blew the dust & cobwebs off mine to see:

The bezel around the window with the two scales you mentioned was inscribed
"multiply by 100" and "high....low rpm"

The data plate reads as follows:

STROBOSCOPE
stock no. 7 CAD-775000
Mfg. model 510
order no. AF-33(604)7723
S/N 413
110/120 volts 1 phase 60cycle
Electronic Brazing Company
Montclair, N.J.

Sadly the schematic inside was a figment of my imagination.

Lots of equipment, as you already know, was made by more than one company,
so Electronic Brazing may not have been the only manufacturer.

Ok Steve. How much work do you wan't to do and how much do you wan't to spend? Be careful what you wish for. The 28 is one radio that will make you feel like you've done some work. Just ask Phil Nelson. Right Phil? The A versions a little easier. I like alining the 28s better than the 28A because those iron core trans/coils in the RF deck of the 28As can get stuck or be loose. You can chip em easy too if your not careful. I just like the brass screw on the older ones better. They may be the reason the 28 is a little better performer than the 28A too? One thing nice about the 28/28A is its a radio you will listen too. Its fun to use so the work is worth it.

Has it got to be a big 1950s style one?

You can use the little Toko types without any problem, honestly, but
they don't look right unless you use submini tubes, of course.

You could always parallel-feed from a choke, and isolate the IF transformer from DC with a cap. This would provide a much nicer environment. Then if you had to you could build big boxes to put the transformer and bypass stuff into, and it'd even look right.

Best-looking of all time? Nobody insults my National NC-2-40D without a fight! It's even on the cover of Osterman's book on communications receivers. The SP-600 series has to be a close contender. But unless you've got a thing for little steering wheels as tuning knobs, the National has the Deco look down much better than the SX-28. Even the speaker has those cool squatty Deco feet.

But it does raise the interesting question: what in your opinion was the best-looking communications receiver ever produced? Brian's not eligible to vote, because he's wrong. :)

I don't like the peep-hole windows like Hammarlund used. A radio
should have a BIG scale and big knobs.

NC-270
SX-62

The metaphore scales are confusing too, HRO, Collins. It's too much
like looking at a movie through a soda straw. Don't get me started
on digital displays. What's that, a bunch of numbers. It doesn't
show me where the station is in the context of the band.

SX-101A, now there is how 40 meters should be splayed out.

While I have the floor, anyone remember the big 20 meter antenna
that was on the cover of QST in the mid 1960's. It was six
6-elements wide spaced on a 210 foot tower.

Is it still on the air? Are there pictures of it on the web? There
was a similar big 20 meter array in Europe. Might have been in
Norway.

Henry -

It is part of a General Radio Type 631-B or 631-BL Strobotachometer.
The plate that identifies it was on the top of the case, which is
missing. It was probably manufactured in the mid-to-late 1950s.

I have for sale an Eico Model 753 3 band SSB, AM, and CW Transceiver. I have one transceiver that appears complete along with an AC Power Supply. In addition there is another 753 Transceiver that is a parts rig.These transceivers cover 80, 40 and 20 meters. This gear is from an estate and has not been used in many years. I is dirty but looks restorable. Price for the lot is $75 plus shipping from 79602.
Thanks, Charlie Hugg, K5MBX

How about getting a digital frequency display for the S-108. I use one
with several of my boatanchors. Here's a website that makes digital
display kits for shortwave receivers:

Stifling the Urge to Shop
From HealthDayNews

July 25 ï¿½ The common antidepressant Celexa helps control compulsive shopping disorder, a condition marked by binge shopping and subsequent financial hardship.

A study by Stanford University Medical Center researchers found people who took the drug scored lower on a scale that measures compulsive shopping tendencies than people who took a placebo.

"I'm very excited about the dramatic response from people who had been suffering for decades. My hope is that people with this disorder will become aware that it's treatable and they don't have to suffer," study author Dr. Lorrin Koran, a professor of psychiatry and behavioral sciences, says in a news release.

It's estimated that between 2 percent and 8 percent of people in the United States are affected by compulsive shopping disorder. People with the condition have a preoccupation with shopping for unneeded items and an inability to resist buying such products.

Some people who suffer from the disorder end up with closets or rooms filled with unwanted purchases. For example, one person in the study bought more than 2,000 AM Radios, while another owned 55 cameras.

People with compulsive shopping disorder often damage their relationships with loved ones because they lie about their purchases and rack up enormous debts.

> and to think, I thought all this time it was a hobby. Guess I'll have to sue the ARRL for this addictive disease. Compulsive Hamming Disorder (CHD)

No argument here. And how come nobody's suggested the HRO-60? Remember, we're talking APPEARANCE, not functionality. The HROs were a pain to read frequency off the dial, but oh, the feel of that dial...

I've got a couple of other nominations, if the jury permits:

1) RME 4300/4300A (which in a way resembles a modern NC-2-40D, or at least the big semicircular dial does).

2) RME 6900, with a front panel laid out so the dial and every control are in perfect harmony and proportion. Sort of a feng shui receiver.

3) For all you SX-101 lovers, who simply love that humongous dial, I vote for most of the Eddystones of the '50s & '60s. They not only had the same huge dial scale, but also a tuning mechanism that was beyond smoooooth and like the RME 6900, a beautifully designed front panel layout.

How come nobody's mentioned the Collins S Line? Simple, elegant, luxurious touches like the pebbled overlay.

Fun!

Ahh!! Thank You Avery. I nominate the TMC GPR-90 because it is pretty and
The Hallicrafters SX-11 because of the airplane dial and the eye tube tuning
indicator plus the cool brass thumbscrews on the front. Ta! Da!

Okay, okay. Nobody ever said 390 junkies are rational. Look, I owned one. I was dazzled by the Rube Goldberg machinery behind the front panel. All those gears! Cams! Moving arms! But since when did defense contractors build for show as opposed to efficiency and functionality? C'mon. Name one military radio that looked better than its civilian equivalent. At least the SP-600 didn't look that much different.

345. FS: Kenwood TS-830S Gold Edition and VFO-230

Newsgroup: rec.radio.amateur.boatanchors
Date: 2004-01-14 01:26:16 UTC
From: k9sqg@aol.com
Message-ID: <20040113202616.12155.00003002@mb-m05.aol.com>
Source record: 26306

Have for sale some excellent condition Kenwood gear. I'm the second owner. TS-830S Gold Edition has the narrow CW filter. Excellent condition. $400 plus shipping. I tried it on 75 and 40m ssb and got good audio reports. Didn't check if the WARC mod was done or not; just involves clipping one or more diodes.

VFO-230 is the digital synthesized vfo. Includes interconnect cable. Excellent condition. It has the "slow tuning CW mod" that enables smooth, easy tuning with the narrow CW filter; mod is reversible. $250 plus shipping. Will not sell the VFO alone unless the transmitter sells first.

I cannot sell or ship outside continental US unfortunately.

Thanks for reading the posting.

73s,

Evan

Two good nominees, IMHO. But if the GPR-90 (which I like, too) is a candidate, why not Hammarlund's more modern HQ-1XX series of receivers (HQ-145, -170, and -180)? The layout is pretty similar.

If you've ever seen a GPR-90 in person, you wouldn't have to ask. It is MIL-SPEC in construction, the Hammarlunds are *definitely* not (although I do like some of them, mainly the ones without the cheap clock).

I, too, vote for the GPR-90, and any HRO other than the HRO-7 (it, too, looked cheap!).

No, the 303 didn't have all the bands in front of you the way the
NC-270 did.

I have a theory about these radios. I have a pal who is a "spec"
reader. You know the type. He doesn't have a good feel for
"real-world" phenomenum but he can memorize numbers and parameters.

A lot of radio guys are "spec" readers, 3rd order intercept,
fractional microvolt sensitivity, the more esoteric, the better they
like it.

The real world ain't a bunch of specs. It's how you use the tool,
not the size in mm.

The NC-270 had a nice look, a unique color scheme, that flywheel on
the tuning knob, and decent enough electronics.

I really appreciate BIG slide rule scales and smooth tuning knobs
with some heft to them.

I'm not saying that the '303 wasn't a great radio. It was.

I simply appreciate a radio with the scales in front of you. My old SX-101A was a nice radio. It gives you a better feel for the band layout than, say, an S-Line, HRO, or one of the new digital boxes.

I like maps because I can see that "this" is close to "that". You don't get that sense from a digital radio.

Anyway, these are all interesting and fun.

I owned a GPR-90 for several years and agree about the build
quality--but we're talking esthetics in this thread, so you're not
allowed to bring up unimportant side issues like quality of
construction, performance, reliability... ;)

So just on appearance/esthetics/ergonomics (what really counts,
right?), I have to say again that the basic look and feel of this
radio is interestingly similar to that of the better Hammarlunds.

Haven't read what others have said, but a "seat-of-the-pants" method of neutralizing the finals of any HF rig is to load up on 10 metres, preferably into a dummy load, with a wattmeter in the line. Key the rig and adjust the neutralizing capacitor so that maximum output, as indicated by your wattmeter, and dip in final plate current occur at the same time. It works! Cheers es

The only possible answer is that God intended all radios to look like that. Either that or somewhere deep in the bowels of the engineering department, at midnight Sunday with no engineers around, that design brutally eliminated the competition, leaving no evidence but a few whiskers of pot metal and the pungent aroma of burned insulation....

I wholeheartedly agree with your conclusion. I'd also agree with you and your friend regarding the "how you use the tool" case to be made for a radio that is easy and intuitive to use. I think that accounts for much of the popularity of Grundig's Satellit 800, a 15-pound "portable" that is remarkably straightforward to play with--nice big display (digital, yes, but that makes sense for shortwave), nice big knobs, one function per control. Good overall performance, too.

376. WTB: Heathkit DX-100

Newsgroup: rec.radio.amateur.boatanchors
Date: 2004-01-16 00:15:55 UTC
From: Will <willbrown@nospamsympatico.ca>
Message-ID: <C2GNb.1135$XZ.165672@news20.bellglobal.com>
Source record: 26338

I picked up a DX-100 about three years ago with the intent of restoring it. But this little transmitter had been exposed to water prior to my getting it, and the copper plate chassis is all corroded, and the main transformer is pooched.

I wanted to know if anyone has a DX-100 in moderate shape for sale, or know where one exists, and for sale. the plan is to restore the second acquisition with parts from the first.

I realise that it is not easy to find one, but hey, I believe in miracles!! ;-)

Please reply making the obvious changes to the return address.
Will

I have the following items for sale that are excess to my needs. Prices
do not include shipping. I will ship overseas.

Gonset Communicator III - 6 Meters.....$75 plus shipping
This is a separate receiver and and crystal controlled transmitter from
the 1950's . Unit works but needs dial cord restrung on receiver.
Includes a bunch of crystals. The radio has a number of scratches.
http://members.cox.net/radiostuff9/gonset_comIII_6m.jpg
http://members.cox.net/radiostuff9/gonset_comIII_6m2.jpg

Lafayette HB-76 VHF Receiver.....$35 plus shipping
This is a VHF receiver from the 1960's that covers 152-174 MHz. The
unit is in excellent condition cosmetically and does work.
http://members.cox.net/radiostuff9/laffvhf.jpg
http://members.cox.net/radiostuff9/laffvhf2.jpg

Signal Corps U.S. Army Test Set Frequency Meter Test Set I-129-Bï¿½ï¿½ï¿½.$125
plus shipping.
Military set of James Millen wattmeters covering 1.5 to 40 MHz. Case
manufactured by Hickok .Excellent condition
http://members.cox.net/radiostuff9/wavemeters1.jpg
http://members.cox.net/radiostuff9/wavemeters2.jpg
http://members.cox.net/radiostuff9/wavemeters3.jpg
http://members.cox.net/radiostuff9/wavemeters4.jpg

ZM-3A/U Capacitance Analyzer.....$75 plus shipping
Nice unit, works well, new power cord. Insides look like new. Don't have

a manual , however they are available from several sources on the
internet
http://members.cox.net/radiostuff9/zm32.jpg

Book - "The Portable Radio in American Life" .....$25 plus shipping

This is a 260 page book published in 1991 covers the
history of portable tube radios and transistor radios from the 1920's to

the 1970's. Includes historical information on Sony, Zenith radio,
Admiral radio and many other brands who built portable radios. This is
an excellent reference book if you collect portable and transistor
radios. These are new books. This is a great radio reference book. I
have 3 of these books left.
http://members.cox.net/radiostuff9/portableradiobook.jpg

Set of crystals for the Navy TDQ transmitter...$75 plus shipping
Their are 24 crystals of which 23 are the original Navy crystals; one

crystal is not. The wooden box is in great shape also.
http://members.cox.net/radiostuff9/tdq_xtals.jpg
http://members.cox.net/radiostuff9/tdq_xtals2.jpg

Sonar LP Filter - NIB E.F. Johnson Clone.....$40 plus shipping
This looks like a clone of the EF Johnson low pass filter however it has

a neat chrome finish. This is new in the box with instructions and
mounting brackets. This is a 52 ohm filter that will handle 1 KW from
2-30 MHz.
http://members.cox.net/radiostuff9/sonar_lp_filter.jpg

National Type MCN Vernier Dial - New in Box!.....$40 plus shipping

http://members.cox.net/radiostuff9/mcn.jpg
http://members.cox.net/radiostuff9/mcn2.jpg

Drake ML-2 Marker Luxury 2 Meter Transceiver.....$60 plus shipping

This 1971 2 meter transceiver has a solid state receiver and a tube
final putting out 10 watts plus. Also has a built-in AC/DC power supply.

This one is in nice condition and works well. This one has the original
crystals for 34-94, 94 Simplex. For more info on this radio visit this
link: http://www.dproducts.be/Drake_Museum/ML2.htm
http://members.cox.net/radiostuff9/drake2m.jpg
http://members.cox.net/radiostuff9/drake2m2.jpg
http://members.cox.net/radiostuff9/drake2m3.jpg

Years ago, in another life, I worked in radio. There was a small test set that measured RF so that the station engineers could tell the contours still matched the promise of performance. Can't remember what they were called and who manufactured them. Anybody?

They were in a beige case with a meter on the front and were fairly BIG $.

Potomac Instruments FIM series were that color. The earlier ones went
under their name and Nems Clarke, RCA, Vitro?, maybe some others. They
were good radios. Still have two of them around somewhere.

Field Intensity Meter or a Field Strength Meter or an EMI Receiver.

Beige case (maybe one for meter and one for the power supply?), big $ =
Stoddart NM series meters.
Same, but gray crinkle, bigger (but only one) box, big $ = Empire NF-105
meter.
Really, really big case, microwave, pale green & beige, really big $$,
Polarad FIM meter.

OTOH, hand-held beige, modest $, maybe a Narda power density meter (did it
have a separate hand-held wand?).

As my old brain remembers they were regenerative, fair size meter on the
front, well made case with rounded corners, the size of a lunchbox and
stored in a wooden box. I think Potomac Instruments may be the one.
Now there's just finding one. ;-)

The following old radio items are offered for sale. Shipping is
INCLUDED in the prices. Check or M.O. accepted.

Thanks for looking.

-Al Schapira, KC2HRH, a.schapira@worldnet.att.net
==========

Item 1. 3 "basket weave" coils, used excellent
2 each, 3" dia x 1", 1 2 1/4" dia x 1"
Picture at
http://home.att.net/~a.schapira/pix/parts/catacomb/PICT0001.JPG
$10 shipped.

Item 2. 5 air variable capacitors, used, excellent
All have 1/4" shafts and ceramic insulators
2 each, brass plate Hammarlund ~20pF (labeled on the plates)
1 each, Cardwell ZR-50-AS ~50pF
1 each, unknown ~40pF
1 each, trimmer ~50pF
Picture at
http://home.att.net/~a.schapira/pix/parts/caps/PICT0001.JPG
$10 shipped.

Item 3. Air variable capacitor, unused ~100pF
Has 1/4" shaft, 10 plates, and ceramic insulator
Picture at
http://home.att.net/~a.schapira/pix/parts/caps/PICT0002.JPG
$5 shipped.

Item 4. 12 toroids, unused, all w/ at least 6" leads
2 each, toroid transformers (4 leads) labeled "INDR 1533H"
6 each, toroid inductors (2 leads) labeled "INDR 1532E"
4 each, toroid inductors (2 leads) tagged "D175228 450 turns #28"
Picture at
http://home.att.net/~a.schapira/pix/parts/toroids/PICT0001.JPG
$15 shipped.

Item 5. Loral Disk capacitor assortment in original drawer/box.
Loral Kit C 120A, consisting of a drawer of 24 plastic boxes,
containing disk capacitors, assorted values, some boxes empty, some
boxes are Sprague, not Loral, includes approx 75 disk capacitors.
Picture at
http://home.att.net/~a.schapira/pix/parts/loralcaps/PICT0001.JPG

$15 shipped.

Item 6. GC Stackpole 60-line Carbon Resistor assortment, in original metal cabinet, wall mountable, containing 28 of 30 plastic boxes containing 1/2 watt carbon resistors; 2 plastic boxes missing. Includes approx 80 resistors.
Pictures at
http://home.att.net/~a.schapira/pix/parts/stackpole/PICT0001.JPG
http://home.att.net/~a.schapira/pix/parts/stackpole/PICT0002.JPG
$20 shipped.

Could you scan the data sheet, and other reference material and put
them on your website, or post them to news:alt.binaries.pictures.radio ?

I would love to have these, but I am still out of work, so someone
else will get them. :(

And you actually *get* some buyers.
Trying to sell stuff direct is difficult, unless you
want to just give it away. Also, you have the problem
of 4-5 of your friends wanting the *one* neat goodie you have.
After 3-4 of your buddies miss out a few times, they
tend to get testy; it's just human nature.
The "FA" listing gets around that problem.

The Potomac FIM-41, which covers the broadcast band, is see on Ebay
from time to time. There was another one with broader coverage that
I've never seen for sale anywhere. Those might even be considered
rare. Still a ton of 41s and the older ones still in use by AM
directional stations. I've got two of them sitting right here but I
don' want to open them up. Best I recall they are just standard
portable radio type superhets without AVC.

396. FS: FTS 5060 Cesium Frequency and Time Standard

Cross-posted to: rec.radio.amateur.boatanchors,rec.radio.amateur.equipment

Hi Gang,
I know there are lots of folks here that prefer the older tube equipment. I'm looking for a Kenwood TS-520 as a back-up rig. I have;

HW-101, works well but needs new electrolytics, front panel has NO scratches or dents, cabinet has some scratches. Manual and CW filter included

SP-600 and HP-23B speaker/power supply and cable

Heathkit Power/SWR meter (HM-102?)

solid state keyer (not Heathkit)

I'd prefer a Kenwood TS-520 but will consider a TS-820. Must be in good cosmetic condition and complete. Minor technical problems are OK as long as you tell me what they are upfront. Plus or minus cash as condition warrents.

I'm located in Santa Rosa, CA. which is 50 miles north of San Francisco.

Steve W6SSP

I own an SX-88 and I had no hesitation in recapping it. I use it regularly.

If you're not going to replace the old capacitors, then DON'T turn it on.

I collect radios for the purpose of restoring and using them, so the concept of owning an unplayable "shelf queen" holds little allure. I doubt that recapping would seriously affect the value of this particular set, but then I don't operate a museum full of shelf queens. You can always save the old caps in a sack in case some future owner wants to restuff them. Keep in mind that it's basically impossible to restuff a plastic cap such as a Black Beauty.

Looks nice as compared to the earlier S-40 series which it replaced. The only problem is that it was no more stable than the S-40B on 15 and trying to tune in CW signals you used much of that 1800 degrees of bandspread touted by Hallicrafters.

Sure, why not. And rather than waste good new mylars inside those repros, he can have a few hundred bad old paper caps from my saving-sacks. Then he can peddle the repackaged "bumblebees" to guitar guys on Ebay for $$$. No point wasting time trying to match up correct values -- those guys want distortion, and I have bushels to offer!

:-)

Message-ID: <100m7njq2igi1ac@corp.supernews.com>
Source record: 26283

From my extensive web research (5 minutes) it looks like this is an internal crystal/external VFO rig, and the transmit VFO was probably sold as an accessory.

If you know the requirements you could probably build one from just about any Handbook from 1948 to the late 70's -- every one that I have from 1953 to 1976 features a VFO that's designed to replace the crystal in a transmitter. Just decide what you want the innards to look like and go. The common crystal-controlled transmitter circuit has one leg of the crystal grounded, and with minor circuit changes or the flip of a switch can take a VFO input at the crystal socket.

I had the same experience when restoring my 2nd Scott 800B6. Someone alerted me during that project that some bathtubs are in fact paper caps, not oil-filled, and you can't really tell the difference by staring at them. I tested them and sure enough, they were leaky as heck. I wired replacements around the original bathtubs, as Mike describes. One of these days, I should go back through my 1st 800B6 and check the bathtubs that I left untouched, on the assumption that they were "just fine."

Source record: 26291

I don't have an SX42 to compare it with, but the SX28A is a pretty decent set, considering the time frame when it was made..... One can spend years comparing these old bandcruisers against each other. Usually each individual set has one outstanding characteristic that sets it apart from its competitors. That's what keeps it from being sold off.

431. Globe Star CB radio -- need manual, schematic, service info, etc

Newsgroup: rec.radio.amateur.boatanchors
Date: 2004-01-19 13:15:59 UTC
From: i_hate_spam@so_dont_send_me_any.com
Message-ID: <jMQOb.498$b77.797@dfw-service2.ext.raytheon.com>

I picked up an old tube-type Globe Star CB radio at a surplus electronics store this weekend. Looks like it's all there and nothing's fried. It came with the power input connector, but it's an empty connector. There is no Sams Photofacts book on this model. Do any of you fine folks have any documentation on this model? At the very least, I'd like to know how to wire the power connector for 115 VAC operation.

Thanks and 73,
Dean K5DH

432. FS: Heathkit SA-2060 2KW Tuner

For Sale: Heathkit SA-2060 160-10 Mtrs 2KW antenna Tuner. It's in very nice overall condition. There are no dents or holes in the cabinet. All original Heathkit knobs. Both the Tuner & wattmeter portions work perfectly. I do not have the manual for it, but I do have the preset chart from the manual to set all of the adjustments to the different bands. The tuner is missing 2 or 3 of the original screws from the cabinet. I'm happy to supply any digital photos of the tuner on request. The price is a firm $215 plus actual shipping via your choice. Contact me at: k2fw@arrl.net

Thanks for looking, Steve K2FW

433. TV-7D/U Transconductance Chart?

Are the antenna impedances the same between the two radios? The older
SX 28A might better match your antenna.

Is that a three channel, xtal controlled set...about a foot wide, but only a few inches tall? If so, the schematic was in the first Sams CB book (soft-bound large format book style, not a folder) which they put out--CB-1, IIRC. It's been 40 years, but I had one 'back when' if it's the same one.

The following old radio items are offered for sale.
Shipping withing the continental US is INCLUDED in the prices.
Check or M.O. accepted.

Thanks for looking.

-Al Schapira, KC2HRH, a.schapira@worldnet.att.net
==========

Item 1. 6 Hammarlund ceramic tube sockets, octagonal, 2 1/4" x 1
5/8",tinned lugs, very good condition,
1 ea 4-pin, 2 ea 6-pin, 3 ea 5-pin,
Picture at http://home.att.net/~a.schapira/pix/tubesox/PICT0001.JPG
$15 shipped.

Item 2. 18 phenolic tube sockets, with removable steel mounting wafer,
7 ea 4-pin (2 unused, 5 w/ tinned lugs)
8 ea 5-pin (6 unused, 2 w/ tinned lugs)
1 ea 6-pin (unused) 2 ea 7-pin (unused)
Picture at http://home.att.net/~a.schapira/pix/tubesox/PICT0002.JPG
$20 shipped.

Item 3. General Radio 4-pin surface mount tube socket and
matching 4-pin plug, unused
Picture at http://home.att.net/~a.schapira/pix/tubesox/PICT0003.JPG
$5 shipped.

Item 4. 2 5-pin tube socket extenders, for trouble shooting from
topside, good condition,
Picture at http://home.att.net/~a.schapira/pix/tubesox/PICT0004.JPG
$5 shipped.

Item 5. Male 5-pin plug, fits 5-pin tube sockets,
phenolic with rubber shell housing, used fair condition,
Picture at http://home.att.net/~a.schapira/pix/tubesox/PICT0005.JPG
$4 shipped.

Item 6. Male 4-pin plug, fits 4-pin tube sockets,
phenolic with rubber shell housing, used rough condition,
Pictures at http://home.att.net/~a.schapira/pix/tubesox/PICT0006.JPG
$3 shipped.

Item 7. 2 "tube type engraved" wafer tube sockets
1 ea labeled for #80 tube, and 1 ea labeled for #27 tube,
used, fair condition

Picture at http://home.att.net/~a.schapira/pix/tubesox/PICT0007.JPG
$8 shipped.

Item 8. 3 large surface mount 4-pin tube sockets,with bayonet key,
1 1/2" x 1 3/8" dia., 2 ea round base, 1 ea square base, unused,
Picture at http://home.att.net/~a.schapira/pix/tubesox/PICT0008.JPG
$15 shipped.

Item 9. 10-pin phenolic cable plug and matching surface mount phenolic
socket, marked "NA-ALO", unused,
Picture at http://home.att.net/~a.schapira/pix/tubesox/PICT0009.JPG
$5 shipped.

Item 10. 5 brown phenolic tube sockets, 3 ea 4-pin, 2 ea 5-pin, used
Picture at http://home.att.net/~a.schapira/pix/tubesox/PICT0010.JPG
$12 shipped.

Item 11. 4-pin surface mount tube sockets, w/ screw stud terminals,
1 ea General Radio, round base (unused)
3 ea labeled "Ben7amin", square base (used)
Picture at http://home.att.net/~a.schapira/pix/tubesox/PICT0011.JPG
$12 shipped.

Item 12. 2 4-pin cable sockets and plug
2 ea 4-pin female cable socket, (1 unused, 1 used)
1 ea 4-pin male plug, no shell, (unused) mates with above
Picture at http://home.att.net/~a.schapira/pix/tubesox/PICT0012.JPG
$12 shipped.

445. FT-101e Neutralization question

Newsgroup: rec.radio.amateur.boatanchors
Date: 2004-01-20 01:02:55 UTC
From: gil <gilpi@NOSPAMmindspring.com>
Message-ID: <37%Ob.15759$q4.8129@newsread3.news.atl.earthlink.net>
Source record: 26206

Just recently got a Yaesu ft-101e that needed some alignment and the only thing I cant seem to get "accurate" is the neutralization, the best I can do is to rotate the adjustable plate capacitor till I get the lowest output reading on the power meter, which range from 50 to 80 watts depending on the band and it seems to put out a clean signal this way.
Trying to get a higher output reading only sends the finals into oscillation with lots of hum and a somewhat "dirty" signal.
Am I on the right trak here or should I do something different?
Any info appreciated....thanks

For Sale NEW 7036 (6BE6) tubes.
The boxes have the following information on them:
5960-00-074-4833 ELECTRON TUBE
1 EACH DLA900-82-G-0017-005
A-3/83 GE-7036 GENERAL ELECTRIC CO. Tubes are 5 to a sleeve.
The 7036 is electrically the same as the 6BE6 but it physically
taller. It is the same height as a 6AQ5 so tubes shields will
not fit from a 6BE6.
$10.00 per sleeve plus $3.85 priorty mail shipping U.S. locations only.
1-4 sleeves $3.85 priority mail shipping
4-8 sleeves $7.70 priority mail shipping
Thanks Larry WA9VRH

447. Re: FT-101e Neutralization question

Newsgroup: rec.radio.amateur.boatanchors
Date: 2004-01-20 01:47:23 UTC
From: Edward Knobloch <alias@nowhere.net>
Message-ID: <LM%Ob.1412$LM4.1331@nwrdny03.gnilink.net>
Source record: 26208

In order to neutralize, you must first open the screen voltage
supply to the 6146's. This may require unsoldering the screen
grid supply at the 6146 sockets (pin 3 of each 6146 octal socket).
Leave the the tubes in their sockets, with plate
connectors attached. On the 10m band, feed some power to the grids
of the finals, and measure the output signal on the coax (50 Ohm load).
You can use a separate, loosely coupled receiver tuned to the frequency
for this purpose. (I.e., use a short antenna wire placed near
the output coax, connected to the separate receiver.)

Adjust the grid tune, plate tune and plate load capacitors
for maximum output signal, then adjust the neutralization capacitor
for minimum signal. There should be a point of the neutralization
adjustment where the output signal has a definite minimum.
Congratulations - you are now neutralized.

Be careful - you are working near lethal voltages, and you should use a
insulated, non-metalic tool to adjust the neutralization capacitor.

Keep one hand in your pocket when you reach into the transceiver,
so you won't get high voltage across your chest. If you don't +know+
what you are doing, ask another ham to help. Don't be alone
in the house when you are reaching around the 800VDC.

Both final tubes should be the same type. It is not good practice
to mix a 6146 or 6146A and a 6146B.

73,
Ed Knobloch

Adjust it so that the plate current dip occurs at exactly the same
point that you get maximum output while you tune the plate tuning
control.

I just purchased a older Kenwood Tr751A, and it is in need of 'tones',
and Vol & Squelch unit . I have installed 'sub tones' modules in my
Ft 736, and it was fairly easy, but my question is how much more
compilicated would it be to install a volume and Squelch unit. Is
there someplace were there is detailed drawings/pictures of what needs
to be done, and explains it in such a manner that a 'dummy' like me
could understand.????? Appreicate any and all input. Chuck L.
remove "z" for email.

The 101E uses 6JS6s, not 6146s. Check and see if they are American tubes or original Toshiba. Most of the original ones had a green stripe around them, but the white letter Toshibas will work just fine. If they are Toshibas you should not have a problem neutralizing them unless one or both of the tubes are bad. If they are American tubes, you will need to change C125, the 100 pF mylar block cap (that is in line with the tunable neutralization cap) to 10 to 15 pF. Then try neutralization.

Good luck!

Because selling items directly can be a real pain in the ass, but not always. You can get more money and better protection for yourself by using a resource like Ebay. There is always a bit of risk but I think it is reduced with FA, also its more fun and exciting.

456. looking for photo showing ARC 5s, and many other airborne surplus sets, all hooked up

Edward - Agree completely with your procedure to neutralize the FT-101E. Should work fine. But doesn't the FT-101E have a pair of 6JSC6 in its final? Might have told the poor fellow there is a difference between the original supplied JA version of the tubes and anything that might be obtain here in the states. That to run RCA or local brand tubes you need to change to small series fixed cap in the neutralize circuit. Can't remember which way or how much its changed. But this is important for with out the change the small neutralization cap doesn't have enough range to do the job..

Good luck,

73 Bob W7AVK

Nope, the Star is not even similar to that one. The Star
is a 5-channel unit about 8 inches wide and 4 inches tall.
It's unlike any of the models that Sams covered in their
Photofacts books (I have a good library of early Sams CB
manuals, by the way).

Makes sense. It's my impression most pre-war designs used a higher impedance antenna input which would work better with an end fed random wire.

Frank Dresser

466. FS: Gonset, Eico, Millen and More

Newsgroup: rec.radio.amateur.boatanchors

I have the following items for sale that are excess to my needs. Prices

do not include shipping. I will ship overseas.

Gonset Communicator III - 6 Meters.....$75 plus shipping
This is a separate receiver and and crystal controlled transmitter from
the 1950's . Unit works but needs dial cord restrung on receiver.
Includes a bunch of crystals. The radio has a number of scratches.
http://members.cox.net/radiostuff9/gonset_comIII_6m.jpg
http://members.cox.net/radiostuff9/gonset_comIII_6m2.jpg

Eico 717 Electronic Keyer.....$50 plus shipping
This keyer was designed to match the Eico 753 transceive from the
1960's. The keyer needs some work. The unit comes on and works
momentarily and than dies which would indicate a defective component or
tube. Includes a copy of the manual.
http://members.cox.net/radiostuff9/eico_keyer.jpg
http://members.cox.net/radiostuff9/eico_keyer2.jpg
http://members.cox.net/radiostuff9/eico_keyer3.jpg

Leader LAG-53 Audio Generator .....$25 plus shipping
This unit will generate both a square wave and a sine wave. Covers 20 Hz
to 200 kHz with adjustable level. The unit works well and is clean and
unmodified inside. It is missing the handle on the top of the case. This
unit matches the Leader LSG-11 RF Signal Generator
http://members.cox.net/radiostuff9/leader_audiogen.jpg

Signal Corps U.S. Army Test Set Frequency Meter Test Set I-129-Bï¿½ï¿½ï¿½.$100

plus shipping.
Military set of James Millen wattmeters covering 1.5 to 40 MHz. Case
manufactured by Hickok .Excellent condition
http://members.cox.net/radiostuff9/wavemeters1.jpg
http://members.cox.net/radiostuff9/wavemeters2.jpg
http://members.cox.net/radiostuff9/wavemeters3.jpg
http://members.cox.net/radiostuff9/wavemeters4.jpg

ZM-3A/U Capacitance Analyzer.....$75 plus shipping
Nice unit, works well, new power cord. Insides look like new. Don't have

a manual , however they are available from several sources on the
internet
http://members.cox.net/radiostuff9/zm32.jpg

Book - "The Portable Radio in American Life" .....$25 plus shipping

This is a 260 page book published in 1991 covers the
history of portable tube radios and transistor radios from the 1920's to

the 1970's. Includes historical information on Sony, Zenith radio,
Admiral radio and many other brands who built portable radios. This is
an excellent reference book if you collect portable and transistor
radios. These are new books. This is a great radio reference book. I
have 3 of these books left.
http://members.cox.net/radiostuff9/portableradiobook.jpg

Set of crystals for the Navy TDQ transmitter...$75 plus shipping
Their are 24 crystals of which 23 (a few duplicates) are the original
Navy crystals; one crystal is not. The wooden box is in great shape
also. Here are the frequencies all in MHz: 5.80,12.90,13.10, 13.26,
13.50, 13.74,13.75,
13.82, 14.02, 14.02, 14.30, 15.62 ,15.64, 15.66, 15.68,15.78,15.84,
15.85, 15.86,15.86,15.86,15.92,15.92, 16.00, 16.24
http://members.cox.net/radiostuff9/tdq_xtals.jpg
http://members.cox.net/radiostuff9/tdq_xtals2.jpg

Sonar LP Filter - NIB E.F. Johnson Clone.....$40 plus shipping
This looks like a clone of the EF Johnson low pass filter however it has

a neat chrome finish. This is new in the box with instructions and
mounting brackets. This is a 52 ohm filter that will handle 1 KW from
2-30 MHz.
http://members.cox.net/radiostuff9/sonar_lp_filter.jpg

Drake ML-2 Marker Luxury 2 Meter Transceiver.....$60 plus shipping

This 1971 2 meter transceiver has a solid state receiver and a tube
final putting out 10 watts plus. Also has a built-in AC/DC power supply.

This one is in nice condition and works well. This one has the original
crystals for 34-94, 94 Simplex. For more info on this radio visit this
link: http://www.dproducts.be/Drake_Museum/ML2.htm
http://members.cox.net/radiostuff9/drake2m.jpg

Doesn't a CRT rejuvinator tend to "zap" the tube with high voltage? Wouldn't this tend to fry the tube?

Yes, The 101E uses 6JS6s, not 6146s, but I get the point.
I guess what I should be looking for is to get the minimum RF out by turning the cap and finding the spot right about the middle...that's where I have it set now and seems to work real smooth.

Thanks all for the help!

Gil

What does "fry" mean?

The CRT rejuvinator applies a very short pulse of a very high voltage
with the cathode positive, in order to clean the passive oxide layer off
the cathode.

Gil,

You don't need to disconnect any voltages to neutralize the finals.
You can easily check to see if you have it properly neutralized by
doing what I said in my last post.

Tune up as normal. Then watch your plate current while you turn the
plate tuning control back and forth. You should get maximum power out
at exactly the minimum plate current. (plate current dip) If these two
things do not occur at the same point then adjust the neutralizing
capacitor slightly and check again. It is not hard to do.
This method is much easier than disconnecting voltages.

By the way do this on the 10 meter band.

>Gil n2wjw

Hi Gil,
A big bag of worms here.... Gary K4FMX, is absolutely
correct in the observation that maximum output should occur at the
"dip" in plate current (around 300 mils) in the IP position of the
switch for the meter. What this means is, when you take the plate knob
and rotate it the meter should "dip" at resonance, and maximum output
should occur at the dip in plate current... Unfortunately, after all
of these years the original Japanese Toshibia tubes are no longer
available, and the American GEs suck when installed, althought they
will work, provided you change the neutralizing capaciator in the PA
cage... As I recall, the original value is 100pf @ 1000 volts, and if
you install GE tubes, in my experience, 10pf to 50pf (means you gotta
experiment) is needed to get proper resonance out of the plate tank,
due to the changes in the American tubes over the years... Remember,
these tubes were meant to be used as sweep tubes in television sets,
so they were never meant to be used as an RF amplifier.. So, if the
manufacturer (like GE) decided it would be cheaper to use a longer
grid wire inside of the tube envelope to save money, that would be
fine for a TV set, but, NOT for RF amplification, (added capacitance,
etc.)... Hopefully, you will have a number of 10 to 50 pf caps at 1000
v to try, and put the fixed neutralizing cap (the "bread slicer") at
half capacitance, and try and make the plate tank dip, whilst trying
different caps, starting with 10 pf, and going up from there, to
produce maximum power at the dip while tuning the plate knob. Of
course, once you get close to resonance, adjust the neutralizing fixed
cap so that maximum power occurs exactly at the dip, not a little
above or below. CAUTION: HI VOLTAGE B+ is present EVERYWHERE in the PA
cage, and don't EVEN think about using a Radio Shack carbon fiber type
of adjusting tool, lest you get zapped... If you have to, shut down
the rig completely, discharge the HV caps by grounding a screwdriver

to ground, and then touching one of the tubes plate caps, you'll see a spark....Then, adjust the tunable cap a teeny bit at a time, turn the rig back on, and see if resonance and max power occur at the dip.. REMEMBER.. B+ is an enemy to your life.... Even with the Heater switch off, there is still over 600 v B+ on the plates of the tubes... Just the way the Japs designed it, and enough to make your wife a widow, so be careful.. One other thought from another post, someone suggested there might be 6146 tubes in this radio, and, this may be so... QST magazine, May of 1999 suggested a way to replace the dwindling (way back then) Toshibia 6JS6Cs... So, if you do have 6146s in your rig, you may wish to look up this version of QST... I wish you luck... I've had to deal with a bunch of these old FT101s, over the years, but, for as old as they are, one has to admit they were designed pretty good, and this coming from someone that enjoys most of all rebuilding old American Radio iron... Best luck and 73 OM... Anthony

480. FS: Johnson Matchbox and TenTec Antenna Tuner

Newsgroup: rec.radio.amateur.boatanchors

I have the following items for sale that are excess to my needs. Prices
do not include shipping. I will ship overseas.

Johnson Viking 275 Watt Matchbox..... $175 plus shipping
This antenna tuner will match antennas with a coaxial fed, open/balanced
wire and end-fed antennas. This unit still has the T/R relay inside
also. This unit is in nice condition with no extra holes or connectors
added. Includes a copy of the manual.
http://members.cox.net/radiostuff9/efjmatchbox.jpg
http://members.cox.net/radiostuff9/efjmatchbox2.jpg
http://members.cox.net/radiostuff9/efjmatchbox3.jpg

TenTec Model 228 Antenna Tuner and SWR Bridge ....$100 plus shipping
This is a 200 watt Antenna Tuner and SWR Bridge covering 80-10 meters.
This unit will match balanced and unbalanced lines, coaxial lines and
single wire antennas. The built-in switch will allow the user to
switch between three antennas and an external dummy load. This unit is
in excellent condition and the LC networks inside show no abuse or
arcing. The meter has the ability to be lit with the use of an external
12 volt dc supply.

Mine is out of alignment and Huntron's site has pdfs for the alignment of units with serial number prefixes. Mine is an older unit without any prefixes and I wonder if anyone might have those instructions and perhaps a manual copy?
tnx
hank wd5jfr

Haven't done alot of looking but you can buy a manual at
http://www.huntron.com/products/accessoryolder.htm
scrool down they have them for 1005b without serial prefixes.

Hi all,

I got a BC669D RTX. It looks in very good shape and I'd like to turn
it back to life. I have no manuals , just a schematic I found online.

Can someone help me suggesting how to power it up without the PE110
unit or how to build an equivalent PS ?

Thanks in advance ,
Roberto SWL I1-4469TO

Hi Hank,

How do you know your unit is out of alignment? They have virtually
nothing inside them that matters. If an open gives you a vertical
line, and a short gives you a horizontal, (45 degree on LOW) line, and
a diode gives you an "L", and a cap an "O", you are as good as it gets.

I would bet that your unit has the same pots in just about the same
locations as all of the 1005's.

Also, the 1005 is *supposed* to have the short circuit trace at a 45
degree angle when in the LOW position.

I have the manuals for my 1005, but it is a 1005B1S prefix 21F. The
manuals have enough staple bound, double sided pages that it would
cost me alot of time, and nearly $50 to xerox at the local Staples.

Sometimes, you have to look beyond the "market value" of an instrument
and see what the instrument will do for you that is of value. My
Huntron has paid for itself 1000 times over. I paid full freight for
my manuals from Huntron.

I agree it's pretty simple but a little correct info would go a long way!
I don't know what high med and low pushbuttons are supposed to do?
I just tweeked a few unlabeled pots carefully to see what effect they had....
And adjusted some that had the "right" effect...
With nothing connected I now get a horizontal line on high and med but a 60 degree slanted one on low!
With leads shorted I get a nearly vertical line on high, med and low!
A 22mf cap gives a decent circle on high and med but a 60 deg. slant line on low..
A diode gives an L on high and med but a V on low...
So if you can tell me what high, med ane low are supposed to do I might be able to adjust or fix it.

Hi Hank,

High, Medium and Low are used to select the maximum voltage that is applied to the device under test. All positions are harmless to all known semiconductor devices.

When the probes are open circuited, you should see a perfectly horizontal line in High or Medium, and a diagonal (corner to corner) line rising from left to right, in the Low position. I stated this incorrectly in my post.

When the probes are short circuited, you should get a vertical line in all three positions.

If you connect to a low value cap, you will see an oval that is more horizontal than vertical, if you connect to a higher value cap, the oval will be more vertical than horizontal.

The patterns will change depending on the selection of High, Med and Low.

Try testing a zener diode. You will see that in the low position it looks just like a diode, in the medium and high position, it will give a zig-zag pattern.

It sounds to me like your unit is working just fine!

-Chuck

Ps, Please post and copy to my email! When people do that, I end up writing two replies to the same post. If you want a personal reply, then just use my email.

Amazing....this machine can be duplicated with a scope and a small AC
power supply. All Huntron did was package it nicely and charge an arm
and leg for.

Circuits for this sort of gizmo were very common in the 70's and are
probably on the 'net

A quick Google search with the terms "circuit diagram curve tester
oscilloscope" found a number of interesting suspects. The one on
Agilent's scope is very nice...

There are some projects in the 1960s ARRL Handbooks that might be of interest to you. I don't recall any 2 or 3 tube designs, but I do remember some 4 and 5 tubers, all single-conversion superhets. If you don't have any older Handbooks of your own, you may find them at your public library.

There's a neat old project book from the late 1960s called "104 Ham Radio Projects for Novice and Technician", published by TAB Books, which has a couple of simple regen receiver projects in it. I see that book for sale from time to time on eBay, and it's definitely worth having if you like to tinker with small tube projects.

Chuck
Thanks for the tips, got the line from 60 deg to 45 degrees by tweaking another pot...
I tested a 30 volt zener and got a good Z but just got as small blip on one leg of the z on a 56 volt zener
I measured the voltage on the probes, 60 Hz, hi: 40.5 volts, med 20.4 volts, and lo is 6.6 volt.
Since these are rms, and peak to peak would be 2.8 higher,,
Does Huntron caution about testing any devices because of the voltage?
With a short all 3 levels show a vertical line but with an open high and medium present a horizontal line while low presents a 45 degree line. Do you know the reason for this?
tnx
hank
I posted a personal reply as well as to the groups as I figured others might be interested.

One of the best receivers I ever built was just an All-American Five with the front end tuned up for 80M instead of BCB. I would think there would be no problem doing that for 40M either.

AA5 schematics are easy to find, and all the parts are available from Antique Electronics Supply. Be careful working on hot chassis circuits.

Hi Hank,

> Thanks for the tips, got the line from 60 deg to 45 degrees by tweaking
> another pot...

The correct angle for the LOW setting should be whatever gives you a
line that goes from the lower left corner to the upper right corner of
the screen.

> I tested a 30 volt zener and got a good Z but just got as small blip on one
> leg of the z on a 56 volt zener

That sounds correct. Nothing about the Huntron is absolute, only
relative.

> I measured the voltage on the probes, 60 Hz, hi: 40.5 volts, med 20.4 volts,
> and lo is 6.6 volt.

The actual voltages will be somewhat higher. The Huntron is a very high
impedance source.

> Since these are rms, and peak to peak would be 2.8 higher,,
> Does Huntron caution about testing any devices because of the voltage?

Huntron is very specific to say that the Tracker CANNOT harm any solid
state device, or other component. I would be worried about some of the
older Mosfets like the 3N128 which have no protection diodes built
in. But in a properly designed circuit, the circuit elements would
protect even a Mosfet.

> With a short all 3 levels show a vertical line but with an open high and
> medium present a horizontal line while low presents a 45 degree line. Do
> you know the reason for this?

The early Huntron Trackers used parts that presented a fair amount of
series resistance to the measurement circuit. This series resistance
wasn't visible in the High and Med positions, but in the Low, it would
have made a diagonal line on short circuit. The folks at Huntron must
have felt that it was more important to make a short circuit always
appear as a vertical line than it was to make an open always appear as
a horizontal line, so they added circuitry that allowed them to rotate
the display in the LOW position to make a short appear as a vertical
line.

In later Huntrons, they figured out how to null out this impedance and
those units always have a short vertical, and an open horizontal.

-Chuck

> hank

I wish you wouldn't!

I check email a lot more often than newsgroups. I don't usually
notice that you have done this until after I have composed and sent
a response to your email. Then when I read the same question in the
newsgroup, and have to reply there as well. A lot of bother.

If you want the reply on the newsgroup, please don't send an email!

Do a web search on tube receiver (on Altavista I do +tube +receiver, which finds only things with the word "tube" _and_ the word "receiver"), then do another on glowbug receiver (+glowbug, +receiver). You'll find _lots_ of stuff. Looking for regenerative receiver will also net you some interesting info.

Lindsay Technical Books (http://www.lindsaybks.com) is in the business of finding and reprinting interesting old technical books, they have some good titles including ARRL handbook reprints from 1929 and '35, as well as at least one book specifically about regenerative receivers.

QST, the ARRL Handbook, CQ, Radio-Craft, Radio-Electronics, and lots
of other publications of the 1930's thru 1950's showed such circuits.
Just grab any old ARRL Handbook or even do an internet search for
"regenerative receiver" and you'll find more than you can build!

I've been toying with the idea of building one, myself, and I've about
settled on one described in the October, 1956, issue of CQ (a four-tuber,
and two of the tubes are dual triodes), although I may start with a one-
or two-tuber for practice.

My last test was inductance and all I got was a straight vertical line till
I tested an 8.6 mH toroid, and it has to be on low. Both high and medium
show a short. On low it can barely detect a 4 mH toroid, it a vertical
ellipse with very little space between the lines. Anything in the specs on
the inductance limits for each range? How about capacitance?
I notice that newer units with prefix serial numbers have a couple of op
amps and a high freq oscillator so they must have more range and be more
sensistive than my unit with no op amps that I can see and the frequency is
60 cps.
Again tnx for going to all the trouble, it is appreciated.

hank wd5jfr
As far a the 3 ranges go, I can see them being usefull

I built one from QST Feb, Mar, or April, 1948. Can't find it right
now. One of the best regen receivers I've ever used. Uses three 6SQ7
and one 6F6/6K6/6V6 or whatever. Copies full carrier AM, SSB, and CW,
and does a very good job. Pix of it under W4IMM at QRZ.com.

515. Poor man's chassis holder

This is almost too dumb to mention, but after years of struggling to prop up heavy chassis on my workbench, it finally occurred to me to screw some heavy corner braces into the chassis mounting holes. Doh! This is especially handy with this particular chassis, which is narrow and heavy. If you put braces on all four corners, you can even turn the chassis upside down without crunching original components.

Very nice Phil,

Here's more to consider. 10 years ago, I saw a rig at a local
small PC shop that was a lazy susan with a rack mounted on it that
held a PC on it's side.

There was a lot to it, storage bins, power strip, etc. Seems to
me that a single vertical brace with a slot in it would hold almost
any radio on its side.

If the brace were tied to a piece of plywood on a lazy susan and
there were hangers for wires as well as mounts for a DVM and scope,
that would make an ergonomic radio work area.

Message-ID: <40113850$0$2823$61fed72c@news.rcn.com>
Source record: 26131
Cross-posted to: sci.electronics.repair,rec.radio.amateur.boatanchors

Hi Hank,

Your machine is working just fine.

The newer 1005's have an 80 Hz inverter built in because they were designed for a more international environment where 50Hz or 60Hz power was possible. They chose 80Hz to avoid most of the annoying beat frequencies that would result if they chose 60Hz and the unit was running on 50Hz or 60Hz power.

Huntron's use of opamps in the later units had nothing to do with improving the sensitivity of the Tracker. It was all about making the unit easier to manufacture.

When transistor circuits get designed by marginal engineers, they often end up with stage gains being so close to the transistor's maximum gain that the transistors need to be selected for proper operation in the circuit. That ends up being a manufacturer's nightmare! National's 2N4401's might work 90% of the time, but Fairchild's only work 10% of the time. This datecode is fine, but that one is a bust...soon manufacturing is looking for an engineer's head to put on a pole.

So by using opamps with their massive amounts of gain, and using lots of negative feedback, a gain stage can be made more cheaply and easily. Gain becomes dependent only on the tolerance of the feedback resistors.

-Chuck

OBTW, Huntron didn't give any specs on what value of capacitor, or inductor, or resistor would give this or that display. It is all relative, all approximate. This is a short, that is an open, and see this angley thing, that is somewhere between a short and an open...

Where the Tracker really shines is when looking at transistor junctions. They all give nice identifiable waveforms. Most Trackers are used for making comparisons between the various points on a bad board and the same points on a good board.

The Basic Electronics Vol 1 was the bible of information when I was in the Navy. I still refer to my copy from time to time. Highly recommended for anyone who doesn't have a copy. It contains all vacuum tube and transistor theory along with formulas you would ever need for working with vintage electronics. Also has log tables in the back in case you misplace your scientific calculator. :-)

Glad someone else agrees with my "bathtub" experience (well, maybe not glad that someone else had to replace one too).

I'm starting to wonder if there's such a thing as a cap that can always be *assumed* to be good (mica, vacuum, etc.). Well, maybe assumed good till the evidence points right to it (smoking resistor, not gun :-) --Mike K.

Great idea, but what about a chassis that has no holes in it for the bolts to go thru? Most readers of this newsgroup would not like to drill new holes in a vintage chassis.

For years I have put off repairing my Philco 38-116, because its huge chassis has projecting studs that prevent it from resting on its sides on the bench. I will probably sell this radio (console) as-is before building something to hold the chassis.

>nightmare! National's 2N4401's might work 90% of the time, but
>Fairchild's only work 10% of the time. This datecode is fine, but
>that one is a bust...soon manufacturing is looking for an engineer's
>head to put on a pole.

At Bell Labs I heard the story of an early transistorized circuit that was in
mass production for years by Western Electric. Suddenly, one year the new
units started giving trouble. Turns out the designer had assumed a *maximum*
gain per transistor. The transistor plant had finally improved the gain of
that type to where the original circuit would no longer work!

Generally, the more negative feedback you put into a transistor or tube stage,
the less finicky it is about how "hot" a device you plug in. --Mike K.

The phosphor is damaged by ion bombardment. Older eye tubes
will have targets that look dark or streaked. You can boost the
the B+ voltage on the target to get some more life out of the tube..

If it's a steel chassis, use neodymium magnets, possibly with electrical tape to enhance friction. The two big problems that you have with these are (a) getting them apart once they've attached themselves to a piece of iron, and (b) keeping their fragile little selves from shattering when you fumble them and they bonk into each other at great velocity.

You can do a web search on on the obvious and get a half-dozen or more vendors. I just ordered some from Gaussboys (www.gaussboys.com); they were very prompt, and the magnets seem to be good quality.

Mike and others,

While this isn't as cheap as brackets or magnets, a wonderful solution is a wooden chassis holder crafted by a retired vocational drafting instructor in Oklahoma City named Steve Strong. He has two sizes, a small one for your ordinary chassis dimensions, and a large one for TV chassis and those from

consoles or other oversized products. I have both. If I remember right, the small one is about $30 plus shipping and the large one about $40 or $45. They are rugged and beautifully made, worth far more. You won't believe the craftsmanship.

The chassis is secured to the holder with metal brackets bolted to the underside. It's easier to see than explain. Once in place, the chassis can be rotated through 360 degrees and fixed in place to work on.

Get in touch with Steve and ask him to send a .pdf file, which will give you a better idea than my description can. Say I said Hi. His email address is scstrong1@cox.net.

Good luck!

Avery W3AVE

I found three apparently unused 803A Transmitting tubes in an estate sale. They are in the original boxes with Navy markings and dated 7-45. I have no way to test them, but they appear unused in the original packing/boxes. Sold AS-IS.
Make a nice conversation piece or possibly a lamp. Perhaps someone has WW2 equipment these fit. About the size of an 813. $15 each plus USPS shipping.
73, K4GJ FL34452 Please respond direct.

Hi,everyone. I'm on the hunt for information on the fr-101. I've managed to successfully restart a non working unit and it now receives about half the amount of signal from the antenna/ generator. I have the schematics(thank goodness for that), but need to have the stage gains if possible.

The RF board has been repaired, low receive across all bands, stable VFO and o/p from same, detecting in all modes, attenuation is functional and well as all other options(rf gain, etc.).

Hope you might have some information.

Thanks for reading,

Lee

Its more or less pretty standard. There's a calibrated dial behind the panel (upper left side). A rotating mask mask reveals the band in use. There's a dial light that sort of works but the bulb is all but unheard of (or at least I can't find any!). I used a RatShak 1.5v lamp. That huge dial-like item in the middle is used for mechanical pre-sets for tuning. BTW, if you obtain one of these receivers, you'll invariably need to change out the old metallic rectifier stack in the HV/AC portion of the PS and the 2 selinium rectifiers used in the filamant circuit. I've got a particularly nice NC-183 in the collection. Although nothing untoward has happened after a number of continuous hours of operation, I do notice that the power xformer get noticeably hot.. as in it can't be touched but for a few seconds. Voltage drop considerations aside (they can be addressed, after the fact), would using a solid-state rectifier, in place of the 5U4, provide a noteworthy temp decrease? 15 watts is 15 watts, of course, but I'm curious if anyone's actually made note?
Thanks de K3HVG

Source record: 26171

Hi,

It isn't too unusual for a power transformer to be run uncomfortably hot. The temperature rise is due mostly to i2r losses in the primary and secondary windings, and partly due to losses in the core. The transformer manufacturers very often run the transformer with a magnetic flux that is approaching the saturation point of the core. This results in the cheapest/lightest transformer possible... But it comes at the cost of cool operation.

If you remove the 15W filament load due to the 5U4, it will cool the transformer down a bit, but probably not as much as you would like.

Here is a way to tell: Pull the 5U4, and leave the radio on for 1/2 hour, or so (without HV). Check how hot the transformer becomes. This t rise is better than the best you can do by replacing the 5U4 with a SS full wave rect. If it is substantially cooler, then you will get an improvement with the SS rect. Otherwise, you should probably just live with things the way they are.

First, have you replaced the filter caps, and the original wax capacitors?
Leaky audio coupling caps will greatly increase the current draw.

What is your line voltage?

If its over 120, I'd suggest using a small 12-volt @ 2 Amp filament
transformer wired in series-buck (or autotransformer) configuration
to drop the AC line voltage at the set to 110 volts. That will help a lot
with the transformer heating!

regards

Peter, k1zjh

I've always used the rule-of-thumb that if you can't keep your hand on a power transformer for more than a few seconds, it's running too hot. But in the case of old gear, the transformer may be near the end of its useful life, rather than overloaded. It's also possible that there is some sort of overload elsewhere in the receiver, causing excessive B+ current draw that will destroy components. For example, a cathode bypass capacitor in the output stage that is shorting out will reduce the bias on the stage, causing excessive plate current. A leaky coupling capacitor will do the same thing by putting positive bias on the tube grid(s) (and it doesn't take a lot of leakge!). Filter caps that are leaking will do the same thing. National tended to use power supplies that were just adequate for the receiver, so any overload can cause excessive heat.

Try this: Pull out the 5U4 and run the receiver without it for an hour or so. The transformer load will then be just the filaments. See how hot the transformer gets under those conditions. Also measure the B+ voltage and current under normal operation and see what's going on.

Source record: 26178

Hi

I wonder if anyone can point me to a web site that has a comprehensive set of definitions of tube base types showing the dimensions (pin numbers, length, diameter etc) and their accepted abbreviation (eg B9A, Ct8, B9B etc).

I have a number of tubes where I find difficulty with base type specification, especially those of WWII European military origin. Some examples of tubes where I don't know the base type include AF100, RGN564, LD1, LD2, VT4C, RG12D60 (all have different bases). Oddly enough specs, pin outs and even photos of individual tube types can be found but many base names and their accepted abbreviations are hard to find.

I have searched many of the well known tube web sites, but those with base details only carry a few common types, so I would suggest that anyone who can help replies to the list as this could be of interest to others.

Thanks Simon

FS: TEN-TEC SP-325 Military MF/HF Communications Receiver
in excellent condition, complete with manual.

Built by Ten Tec to "mil specs" under contract for the U.S. Navy.

Microprocessor controlled
Frequency coverage is 500 Khz - 29.999 Mhz.
Modes: am,usb,cw,lsb,fsk.
64 memories, plus "scratch" memory
Dual crystal ovens for high stability
Direct frequency entry
Memory scan, vfo scan, memory tune
Blue vacuum fluorescent digital frequency display
3 internal FILTERS! 500 Hz, 2.8 Khz and 6.0 Khz.
600 ohm audio output
Dimensions are: 3.469" X 12.0" X 10.5"
Weight is 8 lbs, 4 oz.,
Sensitivity: (S+N/N 10db)uv.

Price is $275.00 firm, includes shipping via FedEx Ground,
insured (Continental U.S. only). Payment by USPS Postal
Money Order only, please.

Contact via e-mail for further info, or for SP-325 pix
(.jpg format)

Check out Franks Electron Tube Data at

http://www.mif.pg.gda.pl/homepages/frank/

you will find the AF100, LD1, LD2, VT4C (look under type 211), RG12D60.

RGN564 is a 4 volt filament tube and the equivalent is a Philips 1803
tube which does not help much

I had a Collins KWM-380 where the xfmr got to hot to touch even after I shed most of the load. Luckily I found a replacment, and the problem was solved. I monkeyed with the bad one, poltted temp vs time and worte it up. I came to the conclusion that it ahd a shorted turn. Any time you can hold your had on a component except for a tube or power resistor it's running too hot and something is wrong. As mentined before, shed some load by removing the 5U4 and testing and then a few tubes at a time to see if that helps. If that doesn't help look for obvious leaks on the heater feed lines, If none are found my guess is you have an xfmr that has a shorted turn/ turns.

I have a Fluke 27 where some of the segments of the display do not darken properly. Is this a known problem, and is there some way to fix it?

cheers, Paul - VA7NT - email: paule@sfu.ca

Many such devices connect the LCD to it's controller board with a layered elastomer (rubber, to ordinary folks) that alternates conductive and non-conductive layers. This elastomer structure just presses against pads on a PC board. I've verified this part by taking apart dead watches and calculators.

What I haven't verified is the failure mechanism or what to do about it. The story that I've heard is that the PC board gets dirty or corroded and fails to make contact, or the elastomer looses it's stretch, or both. In the first case you're supposed to clean the PC board (pencil erasers are _supposed_ to work here), in the second you either get a new display or you find a way to jam it tighter against it's PC board. This was treated in a QST article some time back, but I can't remember the year, much less the precise issue.

Sounds like a type 80, a very common type in it's day. IIRC the 2 in the
280 designation indicates the manufacturer.

Sounds like an '80.

If you replace the four-pin socket with an octal, or make an adapter, you can use the much more common 5Y3GT in place of the "280". They're electrically the same, but 5Y3s are smaller and much less expensive.

TWO IMPORTANT CAUTIONS ON THE BC-348!!

1) The BC-348 uses a rather unique circuit in the last audio, which functions as both an audio power amplifier and a shunt regulator. Under no circumstances should the B+ exceed 220 volts! The ideal B+ supply is between 190 and 220 volts.

2) The BC-348 B- (negative high voltage) is *NOT* grounded! It must be kept isolated from ground in the power supply, unless major modifications are done to the receiver. The receiver will work, sort of, with B- grounded, but it is not recommended.

Complete manuals for the various models of the BC-348 are available free for the download on KG7BZ's excellent website.

"280" is a manufacturer's code. In this case, it's Raytheon. Here's a
list of the codes:

http://www.triodeel.com/eiacode.htm

"026" is probably a date code. Maybe something like the 26th week of
1940 or 1950.

A four pin rectifier is almost certainly a 80.

The plating on the pc board oxidizes, and the rubber hardens due to a
chemical reaction. You can usually clean the zebra strips and PC board
with 100% Isopropyl alcohol, but Fluke should have replacement strips
fairly cheap. The cal lab where I used to work would clean the boards
and strips a couple times, then replace the strips.

That's a Type 80 tube. Go on rec.antiques.radio+phono and you will find
zillions of them, cheap. Or rewire an octal socket and use a 5Y3.

Check those pseudo-mica bypaass caps (pink) mounted along the side of the
chassis. They like to blow out, and take the screen resistor along for the
ride.

Right. The B- must be fed thru a filter choke, whose toehr end delivers it to ground. The negative back bias developed across the choke is used to bias the audio output tube's grid negative. Its cathode is straight grounded, so if you run without this choke and B-, the output will draw excessive current and distort.

That choke is in the same sealed case as the output transformer.

A question for the poster I'm responding to: Is that 220 VDC max including the choke, or just from B+ to chassis ground? I'm assuming the whole thing (choke included). --Mike K.

From: Simon <vk2eii@HATESPAMyahoo.com.au>
Message-ID: <vppb10dvvabgb8e5ids062uri7ubtgpn63@4ax.com>
Source record: 26050

Hi Lionel and other respondents

Thanks for coming back, but I am afraid that I didn't make my request clear. I have all the data I need on the INDIVIDUAL tubes listed, but what I was looking for is details of the dimensions and official abbreviation of the base/holder types that they use.

eg I know that the base type for a 12AX7 is a B9A and that for say a 6V6 is base type IO, or an 80 is a UX4.

I am searching for the base type codes and the dimensions for all smaller tube bases or holders, especially European types.

eg what is the base type for a tube with 8 pegs, 4 on each side and a diameter of 150mm (used for an AF100) -- is it a G8L, a G8A, 8AA or what

It is the codes for the tube holder types that I am after, not specs for the tubes thermselves which are easy to find, as you say.

I hope this clarifies the matter

Regards

Simon

Yep, a bridge of 1N1007's did the trick, in both locations. Turn down the filamant pot, first, then power-up and re-adjust with the filament voltage to the required 1.4 volts. Before replacing the diodes, the best I could get was about 1.2 volts.

I appreciate all the replies, ladies and gentlemen. This receiver has been re-capped, fully and the B+ draw was nominal. But as many remarked, primary power could be playing a big part. I therefore installed a 20A variac in the power distribution setup for all the B/A's and set it for 110v. No more heat problems. Thanks to all!!

Source record: 26064

I recently acquired a very clean and working Triplett 3444 tube tester. The case is in very fine condition as is the unit itself. The old metallic rectifier stacks have been replaced. This unit has 2 accessory tube adaptors with it as well as the book. The roll-chart is in perfect shape. The only "problem" is that one has to let it warm up (although the book does say it requires 15 minutes). Looking to trade for a like-condition TV-7D or negotiate for a TV-2. Thanks.

For most American tubes, they are available in the RCA Tube Handbook.
Reprinted versions of these are available from Antique Electronics Supply.

>eg I know that the base type for a 12AX7 is a B9A and that for say a

European ones are harder, but the Telefunken handbook is a big help, and
turns up used occasionally. Also there is a book called the "Electron
Tube Vade Mecum" which is extremely useful for European types.

605. FS: Heathkit GR-91 receiver - works

Newsgroup: rec.radio.amateur.boatanchors
Date: 2004-01-27 16:59:11 UTC
From: dave <devarim@hotmail.com>
Message-ID: <ecc0765eae6e04f831d97d45e3c90dfe@news.meganetnews.com>
Source record: 26066
Cross-posted to: rec.radio.amateur.boatanchors,rec.radio.swap

I have for sale an old Heathkit GR-91 4-band shortwave tube
receiver. Good physical condition - an easy 8 out of 10, with
no mods I can see. Still has cardboard rear cover and original
jacks for antenna, Q-multiplier, and phones. Has noise blanker.
Face is excellent with no major mars or scratches - one small
scrape near the Antenna Trim control.

Very hot & loud on band A - AM broadcast. It receives on all the other
bands,
but sensitivity is low, and the BFO control needs to be cleaned.\
But I was able to receive SW signals on bands B and C - not much
on the highest band.

Photos to interested parties - $45 obo plus UPS shipping from Seattle
area or local pickup in the Pacific Northwest. I prefer a money order,
but other means can be arranged.

Thanks,

Dave

>
>That choke is in the same sealed case as the output transformer.

Exactly. The wires that come to the dynamotor include "B-" which is not
grounded. Hook it up as described and the choke will be in circuit.
>
>A question for the poster I'm responding to: Is that 220 VDC max including
>the choke, or just from B+ to chassis ground? I'm assuming the whole thing
>(choke included).

It's what you see from B+ to B- at the output of the supply. There's a whole
description in the manual. The idea was to compensate for dynamotor output
variations.

Hi Scott

Thanks for your comments, as you say US stuff is easily available, as
is UK info.

There are some excellent web sites giving tube data, both for specific
tubes and good generic stuff such as the coding built into various
manufacturers/country tube type numbers as well as factoy idents on
some tubes.

Looks like bases are too hard, but maybe some knowledgable person may
post something on the web one day.

Simon

Hi

Both my Hickok Cardmatics, KS-15874-L2 have been mothballed for about 10 years and both exhibit the same symptoms as well as both Cal. Cells are dead (I've seen the reverse engineered schematic and wonder if anyone has had success with repair or an external bypass.) I brought both up on a Variac, no smoke and both draw a little over a 1/2 amp. Cal. B+ indicates the meters are OK . For example neither will test a known good 12AX7, the meter tries to go a little backward on Gm, and the 4 button lamp lights indicating a dual section tube. Does anything come to mind of where I should start or am I facing cleaning off the test bench and staring at hours of learning the circuits for basic troubleshooting each mechanical and electronic section? I kind of feel that there's a common fault that someone with lots of experience might point out.

One of the best experts on tube checkers today , especially on Hickok repair and calibration , is Chris Haedt in Grand Blanc, MI.

He is currently doing some very scientific tests on the way Hickok testers "run" the tube under test, and why certain testers do not seem to give accurate readings on some specific types. This is the first time this kind of research has ever been done to such an extent. Chris has published some of his findings, I dont know where all are, but he could send or point you to some of them I imagine.
If I were you, ask the cost for him to do your tester. He also has restored testers for sale. It seems to me well worth it to have one of his full restorations done. All my testers have been restored by Chris, and fully calibrated, and it was well worth it.

I think Alan Douglas will back me up on Chris' abilities. He is doing some groundbreaking work in this area.

Chris is pretty reasonable. You might want to work out a trade, your fancy unrestored Hickok for an easier to use, more simple fully restored tester.

Henry

Sound like your reader needs to be clean.
Did you stored the Tester with the reader closed, with out the shipping card in?
Have you looked at this http://www.spiritone.com/~nabil/hickok/
Try testing a simple tube like a 5Y3.
would you like to trade one.

Jimmie

629. FS: Globe King Test Cables

Newsgroup: rec.radio.amateur.boatanchors
Date: 2004-01-29 06:33:40 UTC
From: ae4en@earthlink.net
Message-ID: <75eed52c.0401282233.3c6910ef@posting.google.com>
Source record: 26090

I have a set extension cables that I'm not going to need anymore that will aid in troubleshooting those intermintant high voltage problems sometimes seen in Globe King 500's. It seems like they will work on 400's also. These cables are used to pull a deck(s) out of the cabinet and put it under a load to troubleshoot. They can also be used as extra long cables normally used to operate. The main cable hooks all 3 decks together and has a 6 pin octal RF deck connector, a 5 pin octal modulator deck connector and a 6 pin octal power supply connector. There are also 2 high voltage cables with the 4 correct female high voltage connectors used. And for models with a keying circuit (500B and C maybe A?), the correct 4 pin connectors made up in a 3 foot cable. Now the ugly stuff. These cables have been used suscessfully, however...Disclaimer: I will not be responsible for any accidental death or injury resulting from use of these cables. They are extremely dangerous to use. Please let someone qualified work on the 1600 to 1700 VDC that floats around the backside of your Globe King! For prolonged normal use, I highly recommend making the high voltage leads shorter. $25 shipped, prefer paypal, US only. Please respond via e-mail. 73, JP ae4en@earthlink.net

Most often, what appears to be a shorted rectifier tube... It glows and the plates turn red.... is not the tube itself, but a shorted capacitor somewhere in the B+ wiring. There will be no charge for this diagnosis.

Clint, It is more likely a question of cost. Perhaps you have noticed that there are fewer advertisers and the cost of color production and mailing have not gone down. If they don't get complaints, then they won't publish the index.

> hank wd5jfr

I do think that you may have a cardreader problem. One thing that
can happen is the whole assembly starts to slow down due to old
hardened grease. This makes for nice smooth operation--but the
machine will not work properly. The reader really needs to slam to
work properly. It has to "fire" the pins into the mating female
contacts. If you have Alan's tube tester book, you can see a picture
of the reader and the pins that need to be cleaned. A tiny amount of
white lithium grease (I used some from GC for wiping contacts) is a
good idea on the tips of the pins. Cleaning the cardreader is not
that easy, and requires loads of patience. Oh--It's easy to take
apart--but getting it all back together can be difficult--especially
the first time you do it. Plan for a day of careful work and then you
won't get upset. Make sure you do NOT adjust the nuts on the studs
supporting the reader plates. Getting all that readjusted properly is
a minor nightmare. If you see that the wiring is disturbed or messed
up going to the bottom of the cardreader, it may not be a practical
thing to repair.

The KS Cardmatic is my favorite tester, and the one I use 95% of the
time. You really need to rebuild the whole thing for it to be
reliable. Unlike other Hickok designs, there are many high voltage
filter caps to replace. It takes me a couple of days+ to redo one of
these machines--but I feel they are well worth the effort.

The calibration cell is used to check the meter in the tester and calibrate the shorts test function. Original cells used mercury batteries that have all gone dead now. A new calibration cell can be constructed using Zener diodes--that is how the later ones were made.

I'd go for some sort of trade arrangement also.

Do a search on "vacuum tubes" in Google, Altavista, etc. You'll find lots of listings. I usually buy from Antique Electronic Supply, but RF parts and even Newark Electronics has those tubes.

6146s are easy and current production items. Triode Electronics in Chicago has them, and so should Antique Electronics Supply in Arizona. They will be much cheaper than sweep tubes.

12BY7 video pentodes shouldn't fail easily at all, but if you are absolutely sure you have a bad one, Triode stocks them. They are a bit pricey since they were used in some audio amplifiers.

642. No plate dip on TS-820

Newsgroup: rec.radio.amateur.boatanchors
Date: 2004-01-30 06:51:49 UTC
From: Angel Vilaseca <avilaseca@bluewin.ch>
Message-ID: <Xns948050467C211rayomaticcom@212.35.34.213>
Source record: 26003

When trying to tune the final amp on my Kenwood TS-820, I get little or no plate dip.
The amp can be tuned though, but I only get 50 W HF out, instead of 100 W.
Plate current is nominal at 250 mA and 800 V on the 6146B anodes.

I made these measurements with the rig connected to a 50 ohms dummy load and the HF output was confirmed with a HP 432A power mwter.

So I get 50 W HF out for 200 W DC in. Efficiency is terrible at only 25%. All the missing HF power must be dissipated in the anodes because they glow red after a few seconds.

The same thing happens on all bands. Sometimes, when trying to tune on 7 MHz, plate current gets higher than 350 mA and the rig fuse blows.

I suspect there must be something wrong in the tank circuit.

Upon visual inspection, nothing looks charred in there. No arcing noises.

I checked the plate capacitor, which is OK. I unsoldered it and measured it @ .001 uF, as it should be.

So I am wondering where to look next. Any ideas?

many tnx in advance

Angel Vilaseca HB9SLV

One of your 6146B tubes may be gassy. Remove one tube completely
(don't just lift the plate connector), key the rig with no drive
and check that you have 20mA plate current with the remaining tube.
Add drive, tune and load for 125mA with the single tube,
and see if you still get 50W output. Repeat tests with other tube.

If the tubes are balanced, each will draw 20mA quiescent current
with the same setting of final bias adjustment.

Sounds like you have the plate loading capacitor set to high (not
enough capacitance). Try turning it so it is fully closed and then see
if you get a proper plate current dip.

Anyone have a schematic of manual or any other info on this radio?
I've been getting by with a little "Reverse Engineering" and
guesswork. Works FB as an IF for my r-390a. It's the Rycom Frequency
Selective Voltmeter with the big black vernier two speed dial. Scan a
schematic fellow BA folks?

Hmmmmm... Les see... I don't know this rig, but...

No dip.

You say: "The amp can be tuned though, but I only get 50 W HF out..."

I don't know what "tuned through" means Do tell. Is there any kind of a
PEAK in the output power when tuning either the plate tuning or the plate
loading?

Not sure where to go from here, but these two controls, when not behaving
normally, indicate that either there is not a tank circuit (something is
shorted or open). This could be something in the tank ckt OR the tube.

Getting 50 watts seems to indicate that the plate circuit is NEAR resonance,
so something must be close to right. I'd look @ tube voltages (Be careful)

Ran out of ideas.

That's baloney.
Their membership is near an all time high with a couple hundred
thousand readers of QST. They may well have picked up even more
readership after the demise of Ham Radio and 73 magazines.

As another poster said, magazine space is costly.
They did mention something about the index at a board of directors
meeting held several years ago. They've tried to tailer page content
for maximum interest considering the costs involved.

664. Tube tester query?

Newsgroup: rec.radio.amateur.boatanchors
Date: 2004-01-31 14:33:47 UTC
From: k3hvg <jeepp@erols.com>
Message-ID: <401BBCCB.DA1A94D@erols.com>
Source record: 26025

I have a fully functional TV-7 and have recently acquired a Triplett 3444. After replacing the metallic rectifiers, the things work very well. I noticed a post, here, a few days ago regarding the conversion of the scale factors on the TV-7 meter to GM. I noted the GM ranges and decided to compare the TV-7 with the 3444. Before even turning on the equipment, I selected a new 6DC6 tube. Using the test criteria in the TV-7 book, I calculated the expected minimum GM for the TV-7. I then looked at the direct reading minimum GM value on the 3444 rollchart. They are nowhere near each other. I then checked the new tube in both tube testers to see if there was any correlation.. there was none. I did find that both testers agree a tube is good and conversely showed a known bad tube to be bad, when it was.

May I therefore assume that the parameters each manufacturer (Triplett and Hickok, in this case) selected for a given test may be differing, but in each test scenario if that manufacturer's respective minimum value is obtained, the tube can be assumed to be "good"? The above would dispose of a notion that are (were) published tube test parameters that the manufacturers would implement in their designs. The big RCA manual does allude to test standards but maybe they were for them (RCA). Any insights would be helpful. I've been testing tubes since the 50's but never had the opportunity to do this type of comparison. Regards de K3HVG

From: Chuck Harris <cfharris@erols.com>
Message-ID: <401be777$0$2681$61fed72c@news.rcn.com>
Source record: 26027

Hi,

It has been stated since the first tube tester was made that the only
true test of a tube's functionality is in the circuit it is to operate.

Virtually every tube tester, even different models by the same
manufacturer, has different operating points for its tests. Since Gm
is very defendant on plate voltage, current, grid drive, etc. Unless
the manufacturer of tube tester "A" used the exact same operating points
as the manufacturer of tube tester "B" there will be different Gm's for
the same tube.

The test equipment that RCA used in its factories and labs was certainly
more sophisticated and rigorous than what Hickok made for the service
industry.

For instance, on the Hickok testers, the filament transformer uses the
same 6.3V tap for a 6AU6 as it does for a 6AS7. One tube draws 300ma,
the other draws 2.5A. The only way the Hickok testers have of
compensating for the vastly different current draw is to adjust a pot
in series with the power transformer so the primary of the transformer
has the correct voltage. As a consequence, the 6AU6 may be operating
at 6.4V on the filament, and the 6AS7 only 5.5V. The 6AS7 is operating
outside of the manufacturer's specs. So are all of your favorite big
beam power tubes: 6L6, 5880, 6550, KT88, ...

Tube testers are a compromise. The manufacturers of the testers try
out a lot of different tubes to create their tube databases. The Gm
values bear no resemblance to the values found in the tube manuals.

-Chuck Harris

I'm sure that Alan Douglas can give you droves of information on this
subject, or you could buy his highly regarded book.

667. speaker sounding ratty help?

Newsgroup: rec.radio.amateur.boatanchors
Date: 2004-01-31 18:30:20 UTC
From: Dave Edwards <kd2e@comcast.net>
Message-ID: <nLOdnU0xZtijaYbdRVn-sw@comcast.com>
Source record: 26028

I turned on my 75A4 after having been off for a long time, and it sounded
very distorted...not at all smooth.
I figured "well, finally it is my turn to replace them caps".
Just for yucks, I tried it with headphones....sounded fine.
So, I figure the problem is in the audio stage.
Again for yucks, I tried another speaker in the headphone jack.
Sounded fine.
I took a look at that matching Collins speaker. If I apply slight pressure
on the magnet, the sound clears up.
I've had this problem with transistor radios, where the voice coil is not
aligned and the sound goes to heck. I've been able to fix those little 2
inchers by bending them. But this speaker is too big for that.
Any ideas what can be done?
...Dave

Ask your local speaker reconer. Most of these speakers aren't worth the
money to have them rebuilt, but Cardinal Sound in Maryland does nice work
and seems to be able to work on anything.

I take it that it doesn't have any screws holding the spider to loosen
and recenter the voice coil?

If the spider is glued into place maybe it has come loose. If it hasn't
then you can use an xacto knife to slit around the perimeter to free it.
Then you can recenter the coil and glue it back down.

Sometime you get lucky and this works easily :-)

Source record: 26032

Hi,
Chuck replied:

>Tube testers are a compromise. The manufacturers of the testers try
>out a lot of different tubes to create their tube databases. The Gm
>values bear no resemblance to the values found in the tube manuals.

That pretty well sums it up. Incidentally the 3444 is a really
good tester, that runs tubes closer to tube-manual conditions. But as
noted, any Gm tester will rank tubes in about the same order, good to
bad.

I normally use a TV-7B and a KS15874 Cardmatic.

What is baloney is the technical content of the magazine is Zilch.
We are talking about the quality of the magazine, how does that
equate to membership numbers? Besides, Ham Radio was
ten times the magazine QST every was. Even 73 in it's early days.

674. Knight Ocean Hopper Questions

Newsgroup: rec.radio.amateur.boatanchors
Date: 2004-01-31 23:28:38 UTC
From: Larry Loucks <Larry.Loucks@attglobal.net>
Message-ID: <401C3A26.308FFC6B@attglobal.net>
Source record: 26035

I am restoring two Ocean Hopper receivers. One is labeled 223749 706031 706 and the other one is 83Y749 604020 604. They both have the same component values and circuit diagrams.

The manual that I ordered online clearly states that it is for model 83Y749 but there are differences in the circuit diagram. Namely, my version does not use a power supply filter choke, it was replaced with a 680 ohm resistor, and there are also a few differences in component values. The chassises do not have the hole to pass the filter choke wires so they were not modified by the builders. I wonder if anyone knows all of the models and their circuit diagrams? Is the replacement of the filter choke an earlier or later model?

I am currently working on the one labeled 223749. The receiver had a lot of hum but I was able to clean that up by replacing the filter caps. It currently "works" but not nearly as well as I remember. The regeneration is very unstable, so much so that you can't copy CW at all, much less SSB. I used one of these receivers in conjunction with a DX-40 for years when I was first licensed and I worked all kinds of stations on 80, 40 and 15 CW and of course on AM. It was the beginning of SSB and I worked SSB stations as well. So I know it worked a lot better than the one I am currently working on. My original one was cannibalized by my brothers for some project so I don't know what the circuit diagram of the one I had was. I am wondering if there were other circuit changes or if it just some component problems. The resistor values and voltages are all OK. Anyone have any ideas?

Larry

From: Michael Melland <w9wis@charter.net>
Message-ID: <101oiqhiqf7ei96@corp.supernews.com>
Source record: 26038

I have a nice Eddystone 770U UHF receiver for sale. I'ts in very good condition and everything works. It receives from 150 MHz to 500 MHz in 6 bands. All dial lights working, band lights working, receives on all bands. Very clean, unmodified.

Has excellent FM audio on my local PD/Sheriff frequencies... wide "tube audio" on public safety bands has to be heard to be believed <grin>. This receiver was mfg in the UK but there is a dealer label from Canada on it. A few scratches on the bottom of the case (aprior owner had removed the feet... I replaced the feet) and a couple broken plastic push knob connectors on the rear (connectors there but plastic tips broken off) but still an outstanding condition for this 1961 vintage rare (at least in the USA) receiver.

It's heavy... with manual copy... asking $300 plus shipping 60 lbs or so from 54986. Open to reasonable offers as well.... pics available on request.

I was once in the home of a ham who collected unbuilt Heathkits,
and what a sad sight indeed. He had over 50 (FIFTY) of them,
all neatly stacked in a single row against a wall in his 'radio room'
(box room???) - just a wall of brown boxes.

What am I missing? What in the hell fun is that? Or is it just about
dollar value, and that's what makes these folks see 'beauty'? Like
having a large pile of stock certificates and taking them out late at
night with a brandy and leafing through them for 'fun'.

So needless to say, I'd build it. I bought a GR-64 on Ebay for $275
two years ago, and had a wonderful month spent building it making
it work. I still have it, and even if you offered my $35 I still wouldn't
sell it :-)

I have built some unbuilt Heaths (and an unbuilt Eico 753!)
and I have held on to some...and sold some.
If the box is opened up, I say build it or sell it.
Only build it if it can then be used or at least taken care of. I'd buy a
nice cover for
it right away.
If the box were sealed, I may hold on to it for a while.
I have a bunch of unbuilt pieces of test equipment, but don't really need
them...so, I'll hold on to them.
Currently working on an unbuilt Marauder! It was barely started, and never
finished. Age alone has wrecked some of the components....perhaps more than
I even know about as of yet!!

Hi,

tnx for your answer.

I can obtain a very shallow dip in plate current when first tuning at low power (there is a TUN switch on the TS 820). After that , the instructions manual indicates to switch to CW mode, switch to xmit and quickly adjust the plate and load caps while watching the RF out dial. Tune to max power out. That is when I can get 50 Watts out, with the plate control about where it should be as per the numbers printed on the dial and the load cap at about mid-range. Both controls peak quite well.

However, the problem is that there should be twice this power output. Furthermore, after about 10 seconds, the plates of the 6146Bs start to glow red. So I guess that all the missing power output is indeed being generated, but ends up heating the plates.

All of this happens when operating on 20 meters, my favorite band. When trying to tune on 40 meters, things are much worse.
What has happened a couple of times is that when alternately adjusting the

plate and load caps, they don't actually peak. Instead, I can obtain a higher and higher power output and higher and higher plate current, until the rig fuse blows after a few seconds. There must be an oscillation in the final stage. I will re-check neutralization.

Voltages on the tubes are OK: -60 V on the grids, +247 V on the screens, +800 V on the plates on SSB, without modulation.

I too know of such a scenario down here in the islands. (Maybe you were here too?) The guy was a military type and scarfed up all these kits for his eventual retirement pleasure. Last I saw was a 12 ft ceilinged closet just as you described. Easily 50 kits.
He kinda went nuts during retirement and for all I know all those kits are still there. Never knew him to actually use a soldering device, wasn't really his style.

Well one things for sure. This set will go for at least $1000+ bucks and that's a lot to have the privilege of putting one together. The SB-303s are nice little radios but you'll never resell it for the unbuilt price so I guess its a pay for your pleasure type of thing or never build it and let it appreciate like a stock certificate wile keeping a bottle of brandy on hand? I just couldn't resist putting it together.

I figure the shaft is slipping on the load control and the load
cap is locked in full load position,(min capacity)..you would not see
a dip on any band and output would be low.Kenwood shaft couplings are
plastic,they crack and become loose..W4PQW

696. Kenwood TS-700A Power Help please??

Newsgroup: rec.radio.amateur.boatanchors
Date: 2004-02-01 13:44:20 UTC
From: Tuuk <bangkokbob5001@yahoo.com>
Message-ID: <pv7Tb.980$_62.683@read1.cgocable.net>
Source record: 25957

Hi, I have the Kenwood TS-700A, 2m rig, I had a problem with the power cord, got bitten to pieces.
Does anyone know the proper pin requirement? Which of the four pins is to line up with the black, gnd and neutral? I am using it on 120v only but has the option for 220.
There are two horizontal pins, two vertical. Any help would be appreciated.

Thanks

697. Easy SSB Adapter for R-390A

Newsgroup: rec.radio.amateur.boatanchors
Date: 2004-02-01 16:22:05 UTC
From: masoste@comcast.net
Message-ID: <401d233a.186372843@news.tn.comcast.giganews.com>
Source record: 25958

Just in case anyone is interested:

I got tired of looking / waiting for the "real" SSB adapter for the R-390A (or a usable substitute) and didn't want to put any mods into my radio. Here is my fast and semi-dirty solution. It provides an external adapter that works from the 455KC 50 ohm IF output on the rear of the R-390A.

I bought a bad Yaesu FRG-7700 general coverage receiver off of ebay. It had a destroyed display section, but was otherwise ok.

I disconnected the cable from the antenna connector and ran a wire from the connector and through a shiny new bright orange .047 uF cap to the collector of Q-23 (which is actually on the secondary center tap of T-09). Then I just ran a cable from the IF out of the R-390A to the antenna input connector on your new adapter. End of mod.

You now have selectable USB/LSB/AM(with 3 bandwidths), 3 more IF amps, usable AGC (kinda), S-meter, and Audio amp with speaker, phone jack, recorder output and tone control. It works great.

If you are using a working FRG-7700, you could leave the radio intact and add a bnc connector to run the IF input. I decided to gut the rest of the Yaesu out and have a stand alone, no extra knobs, adapter. I removed the entire PLL / logic board (??? whatever they call the bottom board) and everything that wasn't related to audio, IF, and the product detector. This left the top board , power supply and audio stuff.

My scientific approach to eliminating unneeded circuitry was listening to the R-390A through the adapter and one at a time unplugging internal connectors in the 7700. If nothing stopped working I left it unplugged and went on to the next connector. After doing that I removed all disconnected cables and any boards that no longer had anything hooked to them. These boards were then sold on Ebay (boards, VFO, memory board etc)

If anyone else has already done this, I'm sorry I claimed credit for the idea.... havn't heard of it anywhere before. The same idea could probably be done using any old receiver with a 455 IF and product detection at that frequency.

One thing I forgot to mention is that with this "adapter" sideband selection is backwards. To make the switch marking reflect the actual sideband being received, reverse the wires going to pins 2 and 3 of P-14 which plugs into J-10.

BAMA is now being mirrored!

Through the generosity of Bob Duckworth, AH7I and Ed Kujawski, a mirror of the BAMA ftp site is now available. The mirror is a web site, so you will see the ftp archives when you click on the mirror address with your browser. You may find it helpful to look for your manual using the BAMA site and then click on the mirror site, navigate to the file that you want and download it. While the name of the mirror site has yet to be determined, the numeric address is all you need for the moment. Please point your browsers to http://216.24.174.245 and spread the good news!

And a great big "Thank you" to Bob and Ed for helping take some of the strain off of the BAMA server.

73,
Ken K4XL

Just finished going over this set and I was wondering how common of a radio this is? Had to replace the rubber grommets that insulate the chassis from the cabinet. Did a total recap and fixed the kludge that the last guy did, connected the filter cap to the cabinet instead of chassis! Plays pretty good for a little inexpensive set.

I have noticed that some SSB tube transmitters only send a single side band plus the carrier in AM mode. Does this provide a lower quality signal for reception? What are the advantages and drawbacks versus DSB plus carrier AM transmitters? It seems like DSB is the preferred mode for the AM crowd.

Some receivers, such as my SX-101a, will demodulate only one side band which must be selected. Does this provide lower fidelity than full wave AM detectors? Does this compromise its performance as an AM receiver?

SSB+Carrier is known as vestegial sideband and has an efficiency
somewhere between AM and SSB.

However, unless that modeswitch is designated VSSB, I'd look to
readjusting your carrier balance control.

Pin 1 and 2 is for 115vac. To confirm you could put your ohmeter across the pins 1 and 2 and turn unit on with the front panel switch. You should then read the primary of the transformer. Low ohms through the fuse.

Pin 3 and 4 is for 13.8vdc. With pin 3 being positive.

Easy enough! If you didn't need them - why build? Just sell. You most likely couldn't have recouped your time in it any way. You can always build items from other kits or from scratch that you can use or need. I've built many things from scratch using others ideas but incorporating my own additions or mods to them. I had a lot of fun that way too. And yes, I've built many kits. The only pain in the ass from scratch is, rounding up all the parts - at times, can be a pain. I got great pleasure from the kits, but I also got equal pleasure from having to make my own PCB, gather the parts, cut/drill holes in the chassis, etc. A nice working finished project is always nice to have. One reason it's done this way in ham equipment is that it's cheap.
Just unbalance the balanced modulator, and you've got some sort of
AM for use with AM receivers. It takes a resistor off the mode switch,
which is really easy to implement. If you went and bypassed the sideband
filter, you'd get into more complicated switching (because you'd be dealing
with actual signals at the IF frequency).

In boatanchor era SSB equipment, AM is thrown in only for compatibility,
since it dates from a time when there was still significant AM activity.
Hence, that it may not be the best scheme (a low level signal going through
various stages of linear amplification) is irrelevant because anything more
complicated would be costly, for equipment that is really intended as
SSB equipment. A fallout from sending a single sideband, besides less
complicated circuitry, is that the signal chain doesn't have to amplify
the eliminated sideband, so more of the output signal is wasted; if both
sidebands were sent there would be a loss of actual output signal.

There was of course a period when AM pretty much disappeared from SSB
transmitters and transceivers, since there was little point in it since
AM was fading, and by that time, fewer with SSB wanted to talk to those
with AM. It's reappeared, to some extent, in recent years, likely more
fallout from manufacturers wanting to have as many bells and whistles.

In AM days, virtually all of it was generated at a high level (ie plate
or screen modulation of the final amplifier), and then there was no option
but to send out both sidebands. It's only when more complicated equipment
came along with SSB that many amateurs had equipment that could anything
but a signal with a carrier and two sidebands. But with an SSB transmitter,
given sufficient switching schemes, one could generate AM (a carrier with
two sidebands), DSBsc (Double SideBand with suppressed carrier), SSBsc (Single
SideBand with suppressed carrier) and SSBc (I don't think that's the proper

way to designate it, but Single SideBand with carrier). In other words, there was never any real need to send the extra sideband except for simplicity in the transmitter, and the carrier came along for the ride (and of course it allowed for simpler reception). But since the two sidebands are exact images of each other, one is redundant, yet the AM transmitter has to devote some of its power to sending that redundant sideband.

And since the extra sideband is redundant, there is absolutely no loss of "fidelity" if it's not sent, or the receiver ignores it. You can receive an AM signal fine with an SSB filter, tuning issues aside. You will have not lost one bit of actual content by stripping off the extra sideband with an SSB filter (at the transmitter or receiver). Of course, one traditionally used a wider passband in AM days, while with SSB once you had the need for a filter to strip off the unwanted filter one might as well use it to limit the bandwidth of the signal, so one might notice some loss of "fidelity" when using an SSB filter. But this is due to the bandwidth of the filter, not because one stripped off one of the sidebands.

Which model Super Pro ?? At least 4 major designs have carried the Super Pro name, dating from around 1935 to 1960.

I remember back in the 1950s one of the northern New Jersey stations was broadcasting for periods of time in what they called "compatible single sideband." I believe this was full carrier + one sideband. May have operated under the callsign KE2XCC, Long Branch, during the experimental periods. Can't remember which station. I do remember it sounded just as good as their regular signal on my car radio, even if it did tune a little oddly.

717. Re: Questions about SSB + Carrier AM

Newsgroup: rec.radio.amateur.boatanchors
Date: 2004-02-01 22:59:07 UTC
From: Edward Knobloch <alias@nowhere.net>

Source record: 25978

A carrier plus one sideband can sound very good:
witness the CHU time signals at 7335 KHz. (USB + carrier).

That "A.M. Equivalent" mode used to be denoted as A3H,
whilst SSB (no carrier) was A3J and standard A.M. was A3.
(The official nomenclature describing the modulation modes
has become more complicated.)

Someone listening with a 6 KHz IF bandwidth receiver
with envelope detector will hear a bit less recovered audio
from an "A.M. equivalent" transmitter than from
a standard A.M. transmitter,
as if there were a smaller percentage of modulation.

Someone listening with a 3 KHz wide receiver would not notice
the difference between A.M. equivalent and standard A.M.,
because his receiver is in effect converting all sgnals
to A.M. equivalent. One difference: he wouldn't be able to switch
sidebands to dodge QRM.

Regards,
Ed Knobloch

To this I add for your edification an article posted by Chris Haedt, who knows tube testers better than most anybody except for Alan Douglas. He took a known good 12AU7 and ran it through a large number of tube testers. He found the kind of variation you did in your smaller sample. The article should be at www.hickoktubetesters.com. The site may be down. If it is, let me know and I'll send the article as an attachment.

I tried that with the FRG-7700 before going directly into the IF. Got
noticably better sig:noise without the RF amp / mixer and misc noise
of using the entire receiver.

On the bright side of using the complete receiver, you can tune back
and forth across the IF for PBT.

Vestigial sideband is used for the Visual signal in NTSC TV
transmission. The term "Vestigial" comes from the fact that part of the
lower sideband is transmitted to reduce the phase shift caused by the
tuned circuits used to remove most of the lower sideband. In the very
early days of TV they couldn't build accurate filters to remove the full
lower sideband without causing video problems, so a compromise was made
in allowing a small part of the lower sideband to be transmitted.

731. Re: Questions about SSB + Carrier AM

Newsgroup: rec.radio.amateur.boatanchors
Date: 2004-02-02 04:35:12 UTC
From: Gary Schafer <gaschafer@comcast.net>
Message-ID: <4rkr10haav4m9ciuv66ahgpjprbtash0oi@4ax.com>
Source record: 25992

Not exactly right.
When only one side band and carrier are transmitted instead of two side bands (regular AM signal) you loose 6 db of signal recovery. There is 3 db less power in the AM side band because of only one side band. There is another 3 db of loss in the detector because it is not receiving coherent signals from the audio. In double side band AM both side bands combine in the detector to give a 6 db increase in output.

The second problem with it is that when you use a standard diode detector in the receiver (as most AM detectors are), you can not fully modulate the transmitter to 100% modulation or you will end up with high distortion in the receiver.
Without both side bands in the diode detector the second harmonics between the carrier and the one side band become very high and it sounds distorted on high audio levels. You must keep the modulation percentage low to avoid distortion in the receiver. With both side bands this cancels out in the detector.

An SSB transmitter transmitting carrier and both side bands works just as well as a plate modulated transmitter.

But some of the SSB transmitters like the Collins KWS1 did only transmit one side band with carrier. It was easier to do as someone else mentioned. It does sound ok if set up properly but it does not have the quality or punch that it would have with both side bands for the reasons mentioned above.

You have to attenuate the IF signal when doing that or it will
overload the receiver and you get all the noise you mentioned.

I suspect that building it would appeal most to the older guys, those who built Heathkits in their teens. To them, the building of the kit brings a complex mix of emotions and memories. Even the aroma of the parts within the bags leaves a life-long imprint; too bad Proust never built a Heathkit. In those days, just accumulating the money to buy the kit was an exercise in determination. Unless you saved every cent of your "discretionary income" for 6 months to buy & build a Heathkit, you can't understand the excitement that a Heathkit could engender.

To younger guys, who grew up in an era of electronic parts abundance and relatively cheaper consumer electronics items, I suppose a Heathkit is just a box of parts with an insane price tag.

I see all these big prices on un built kits..That`s OK if you just
want something to collect,but, these unbuilt kit components ,like tube
sockets,switches,term stripos,resistors etc.with age will tarnish
,solder will not stick to them...you will most likely have to clean
each and every part very carefully before you attemp to solder
them..could take forever and you would most likely be plagued with
intermittent connections even after that..along costal areas of the
country are worse because of high humidity..."been there ,don that"

Someone has asked if anyone had a Philmore 7001-CR. There's a couple of
up for auction on ebay now.

As hardly anything electronic is manufactured in North America, as a museum piece one day, it might be better to leave it unbuilt. "Yes grandson there was a time when we did make things ourselves in North America and were able to fix it ourselves."

Try bama or the mirrored site listed elsewhere in this group. If that
doesn't work leave a note in the group and i'll look for one when i have
more time.

Sad but true! Kids today for the most part wouldn't have the patience to build a kit. Hell, I bet many wouldn't even know what a kit was! It just isn't the same. Though I gazed through many of their catalogs, I didn't do many Heathkits. Two or three maybe. Did more Eico gear. Loved every minute of it. I miss those days, but as I said in another post, now days I build from scratch. A bit of a pain to gather all parts, but the end result is well worth it. You were right about determination as well. IF a kid, and wanted them, you saved your allowance, cut grass, delivered papers, etc. Eventually, you got the cash plus maybe a plug from the parents to help out more to allow you to get it. You built it. It worked and you enjoyed it because you had time, money and sweat invested. MNS

Like many other endeavors, if someone hasn't actually tried doing it, they have no idea whatsoever what it takes.

Put up a PayPal donation link. In the past year I have made more donations and paid for more "free" software than I paid for shrink-wrapped big-name stuff.

I did the paypal thing -- very little return

So instead I have 3 Affiliate sites -- Amazon etc.

Works much better and pays for about half my costs for a Megasite and I somewhat feel I earned it.

But anyway thanks for the reply.

These days there is a wealth of free info on the internet -- some bad -- most good and I applaud all who do -- a real service to the Ham community as well as many other interests.

My son in law ask me to check and see what a Zenith Long Distance old wooden radio was worth. He just told me he had it 'on' last nite and the am part worked,,,,, I told him he may need a antenna for the SW section of the radio. Would appreicate more ''info/input'' about this radio. He sent me pictures but they are not 'off the net''. I wanted to have a place to "forward" somone to in case they could not bring the radio 'to mind'. thanks in advance.

Hi Mike,

Quite true! However there were several SW broadcasters experimenting with
VSSB in order to free up the congested SW bands.

Probably ought to replace all the electrolytics and paper caps before
playing it very much..
Schematics can be found at http://www.nostalgiaair.org

Once you get a model number a question on rec.antiques.radio+phono might
get you some specifics although "value" questions usually don't get good
response.

Greg,

I think that all are either AM DSB with carrier or SSB with carrier.
There is no reason that I know of to transmit only part of one side
band for broadcast or communications. Other than in TV of course as
was pointed out.

The SW broadcasters use SSB with carrier in order to squeeze into
tighter frequency assignments.

TV stations eliminate part of one side band for the same reason, to
protect the adjacent channel. But they do not abruptly eliminate the
video signal because of the phase shifts caused in the filtering. This
is where the vestigial side band comes in.

I figure it's worth 3X the original price of $389, call it an easy
$1,167. It should go for between $1,000 and $2,000.

"Needs work" SB-303's are going for about $150. I've got several
that I'm restoring. That's as much fun to me as building one from
parts.

Easy to fix, fun to restore, and works well. It hears as well as my
Signal/One CX7A and ICOM IC-720A.

>Hi, I am putting together a 2m and also an antenna for marine use, 156megs.
>Can anyone here please give me some advice on which of these two I am going
>to use? Has anyone here had good luck or horror stories, easily tuned or
>matched?

I posted the following some time back; it's a little long, but it summarizes
my experiences with what I think is an "extended double Zepp for 2 meters":

I've never made any bandwith measurements, but I've made and used several
copper-pipe vertical collinear 2-meter antennas which have served satis-
factorily (i.e., they have withstood ice-storms, I "get out", etc.) for
many years. I don't recall where I got the original design, and, having
just stepped outside and measured one, I'm surprized at how much my
vertical element length differs from that described on page 156 of my old
(1972) "Radio Amateur's VHF Manual", but I heartily recommend them for
their ease of construction, ease of mounting, and ease of matching:

X Y Z (see sketches below)
VHF Manual # 1: 0.475L 0.25L small
2: 0.64L 0.11L small ("small" is never defined!)
where L (Lambda) = wavelength

Note that the total lengths of both designs is the same: about three
half-wavelengths. The second design is an "extended double-Zepp" and
supposedly gives slightly increased gained and lowered radiation angle.

The VHF manual suggests using balanced transmission line or coax and a
balun, but I just use coax tapped on the horizontal part at the minimum-
SWR point found by trial and error. (Mentally, I think of the impedance
at the shorted end of the horizontal section as being zero ohms and the
impedance at the open end being in the neighborhood of 4000 ohms and I
start tapping at an appropriate distance between for 50-ohm coax!)

Assuming 146 Mhz and calculating L = 11200/Freq (MHz) = 76.7 inches
X Y Z
VHF Manual # 1: 36.4" 19.2 small
2: 49.1 8.4 small
Mine: 42.5" 19.5" 2.5"
where L (Lambda) = wavelength

I've made at least four of these things; basically, ONE 10-foot length
of half-inch copper and four matching elbows should come out just right
(allowing about a half-inch each direction for each joint, this takes
2x19+2x41=120 inches of pipe). But when I couldn't get the SWR down as
far as I felt it should go (about 1.5:1), I extended both vertical
sections with a few more inches of pipe.

My first modification substituted two T's for the two elbows at the open end and added a three-foot wooden dowel (with a just-fit diameter) extending about a foot and a half into each vertical section and crossing the "open" end for additional support.

I mounted my first one (#1 below) by (essentially) drilling a couple of holes through the short vertical pipe and nailing it to the wall! One could also lay U-shaped bracket(s) across the shorted end and screw them to the wall or clamp them to a tower. But some other designs (two of which use FOUR T's and NO elbows, and the third uses FIVE T's) give better mounting possibilities:

With design #2, the two horizontal copper-pipe stubs may either be inserted into holes drilled in a board and pinned by driving nails through the edges of the board into the stubs, or the holes may be drilled slightly UNDERsize in a pole and the stubs just driven into the holes.

Design #3 just gives more room for nails or clamps.

There is a little problem with wind trying to swing the antennas around the shorted end like a gate on a hinge, so design #4 adds a FIFTH T CROSSWISE to the plane of the rest of the copper and eliminates all swinging tendencies!

And nobody even mentions that on Saturday, Shaquil (sp??) O'Neil used the "F word" on live television, and when the interviewer mentioned that his expletive had gone out live he replied, "I don't give a shit."

I DID catch that but I missed the tit shot. It was halftime and I was either fixing something to snack on or taking a piss.

I have for sale an Eico Model 753 3 band SSB, AM, and CW Transceiver. I have one transceiver that appears complete along with an AC Power Supply. In addition there is another 753 Transceiver that is a parts rig.These transceivers cover 80, 40 and 20 meters. This gear is from an estate and has not been used in many years. I is dirty but looks restorable. Price for the lot is $75 plus shipping from 79602.
Thanks, Charlie Hugg, K5MBX

I have one and can give you a simple opinion
They are good for for AM reception, fantastic Q multiplier for a basic set.
The oscillator and mixer tube run off a separate transformer 24-7 but his
doesn't help reception SSB much (to much drift) from structural stresses
(main variable multi section tuning cap)
noise blanker is a simple diode clipper.

It sounds like the book by Henry W. Ott, entitled "Noise Reduction
Techniques in Electronic System", 2nd edition.
The publisher is John Wiley & Sone, Inc, and the ISBN is 0-471-85068-3.
Two years ago, the price of this book was $89.50. I am not sure if this is
the book you are referring to, but it is a good book!

If I recall correctly, the SW Broadcasters were going to use SSB with reduced carrier, around 12 db down from normal level.

There was a game on Sunday??? Hmm, I was in my shop fixing radios.

The whole thing about tits in the USA is stupid. In Europe they are on all the tabloids all the time. NO BIG DEAL. When are we Americans gonna get a grip? We have a massive problem with our government that cant get anything right, we have almost no gun control to keep us safe, our schools and healthcare is a mess, and we are worried about tits? I say let them hang out. Lets fix the serious stuff.
we just killed 500+ of our own, and countless in Iraq. We have just struck the beehive because we let a religious zealot run our country. Now we will be running from terrorists for decades, and be in debt for same. Imagine what 100 BILLION would have done for mass transit and urban renewal in the USA. But no, we can go play "shoot em up" in the WRONG place (uh, guys? The Taliban is OVER HERE!!!).

Like a 10 year old kid is gonna be scarred by that? How about the vicious, sickening violent games they play every day on video?
We do nothing about those. No censoring.

I'd vote for wallpapering the schools with tits if it would keep us on the right path politically.

I had pride in our country once, now we are nothing but uneducated, jingoistic, selfcentered overweight slobs. The rest of the world cant believe our global view. "Coalition"??? WHAT "Coalition"??? THERE WAS NO COALITION, not really.... no meaningful country joined it!

the whole thing makes me sick everyday.
Sorry, but I just had to say it.
Vote the bums out this November, please.
Lets try some new bums.

When networks stop pumping garbage into our homes without an invitation,
I suppose. For me it wasn't just the end of Janet's number with her
extra TV exposure, it was her lyrics, those of P. Diddy, Nelly and Kid
Rock, along with the accompanying crotch grabbing. It was Kid Rock
defacing the American flag by cutting a hole in the middle and then
wearing it as a poncho.

> We have a massive problem with our government that cant get anything
> right...

That hasn't been my observation.

> ...we have almost no gun control to keep us safe...

I feel pretty safe. I have guns. If you get guns, you can feel safe
too.

> ...our schools and
> healthcare is a mess, and we are worried about tits? I say let them hang
> out. Lets fix the serious stuff.

Our schools are getting better, not worse. Yes, healthcare is a mess.
The government did not create it. It was a mess under eight years of
Bill Clinton. Yes, we're worried about exposed breasts and the manner
and context under which they are exposed. Let's fix all of it.

> we just killed 500+ of our own, and countless in Iraq.

That is simply incorrect. We didn't kill them. Others did.

> We have just struck
> the beehive because we let a religious zealot run our country. Now we will
> be running from terrorists for decades, and be in debt for same.

Under your logic, we'd be running from terrorists. Now we are not.
We're doing something about them. Just so we can get a handle on your
views, do you see anyone who accepts Christianity as a "zealot"?

> Imagine
> what 100 BILLION would have done for mass transit and urban renewal in the
> USA.

We could use the spiffy new mass transit systems to get away from terror-related events. We'd need the urban renewal to repair the damage from those events.

> But no, we can go play "shoot em up" in the WRONG place (uh, guys?
> The Taliban is OVER HERE!!!).

Firstly, we're not playing. Secondly, I'd say we picked a couple of good spots.

> Like a 10 year old kid is gonna be scarred by that? How about the vicious,
> sickening violent games they play every day on video?

Would you want your child exposed to the words and actions which took place during the halftime show or have you become deadened to these things through overexposure? And yes, how about the vicious, sickening, violent video games which kids play. Let's do something about those too.

> We do nothing about those. No censoring.

You are a part of the "we". What are you doing about them?

> I'd vote for wallpapering the schools with tits if it would keep us on the
> right path politically.

There's a pleasant image and a standard for all to follow.

> I had pride in our country once, now we are nothing but uneducated,
> jingoistic, selfcentered overweight slobs. The rest of the world cant
> believe our global view.

Speak for yourself.

> "Coalition"??? WHAT "Coalition"??? THERE WAS NO
> COALITION, not really.... no meaningful country joined it!

Maybe we have different standards.

> the whole thing makes me sick everyday.
> Sorry, but I just had to say it.
> Vote the bums out this November, please.
> Lets try some new bums.

Actually, you didn't have to say it but if you'd like to politicize the newsgroup, just keep in mind that not everyone believes as you apparently do.

Not sure what show it was, but was on TV this AM, in the hallways of the stadium (I believe), one of the other performers(?) who was there got into a toss game sort of, her top was loosely fastened and out plopped her breast too! The TV show fogged it out though. Same claim made, costume default or some crap. Funny, ALL stations yesterday covered up the breast when they reported it, but CNN had shown the whole thing. I guess being a cable network which is supposedly exempt from some rules, they can get away with it. Yet CBS itself is looking at a $27, 500 fine OR - ALL - CBS stations face fines. I truthfully don't know how if they were unaware of it, it could be helped. Unlike a lot of talk shows which are on a time delay, this wasn't. Jackson's can get away with anything, so it seems. IF this is a look into the future, I hate to see what is next. Admit it folks, the grabbing of one self in public, etc.. the commoners get busted for lewd gestures. WHY should THEY get away with it? Like her Brother Whacko Jacko, had any one else done as he did with his child, they'd have lost their kid in a heart beat for endangering a child. TV PERSONALITIES should have NO rights over any one else to do it and excuse it away. That crap was planned pure and simple IN BOTH cases. MNS

Not really, when you consider that 10% of the World's crude
oil reserves are underneath the geography of Iraq. (That's a
couple trillion !! barrels of black gold that Halliburton would
do anything to get ahold of - including sacrificing the lives of
numerous American and British military personnel. Sad but true)

790. Testing ceramic tubes

Acquired about a dozen 8122 ceramic tetrodes (400 Watt dissipation, 500 Mhz max) pulls from a broadband EMC amplifier. I have no use for them other than trades or ebay.
Anyways, I'm thinking to test these things for emission I make a socket adaptor from the 8122 to something octal that my Hickock tube tester might deal with say a 6146 and test it as such.
Won't know pass / fail but at least I can get an idea if they are all about the same results and weed out any duds.
Anyone ever try such ?

Prefer gold trimmed (HP)model, but don't let that kill a sale.
Specify options included if you have one to part with.
Electrical condition not important, but prefer decent cosmetics.
Will pick up anywhere in 8,9 or 0 land.
Thanks for stopping by.

I started out in 1963 with a Lafayette HE-80, an almost identical
rcvr to the HA-230. After a few years I gave it away to a Novice.
The ex-Novice still has it, still working, with all original tubes,
and it sounds good on A.M. Note that the receiver gets quite deaf,
and needs realignment about every ten years.

I ran one in 65 as a novice ....drifted like my uncle when he came out of the Polish club on Sat night. I would have to keep one hand on the bandspread and retune after a guy came back to me. The receiver went limp above 40 meters. Also the bandswitch was subject to wear and consequently needed to be "tweaked" from time to time. I even removed it in hopes of a fix ...didn't work. It was a nice SW rx for AM but what could a kid afford then ... I gave mine to my nephew who enjoyed SWLing.

God Bless 73 KI3R Tom Popovic Belle Vernon Pa.

Just my point, "Llyod" (sic)...

If you cant even spell your own name, its time to hang up the democratic thing and go back to a kingdom!

BTW, I love the USA when its right, fair and mighty. Not just mighty. We have proven to all we can blow the shit out of anything. Putting stuff together (like a real coalition) we cant seem to do. NOW look at the mess we've made. We'll be in shit for hundreds of years. These folks have MUCH longer memories than we do! Hell, OBL took just 15 years to put together the WTC attacks... thats like .2 seconds in Islamic time.

Have you tried the basic stuff first, like installing a new pair of
final tubes?

How much plate current are you using, at maxium?
at minimum dip?

Is the antenna within the proper impendance range?
Tried tuning up using a dummy load?

Did this problem happen suddenly?

Doug

Free to the readers --- costly to the wemaster -- just ask any of them.

I pay my provider (like earthlink -- but not earthlink) a monthly fee to
connect to the internet.
you can get charged extra if the bandwidth is exceeded.
And a megasite can easly have way over the bandwidth they limit to.

Earthlink did that to me -- sent me a $140 bill in addition to my $29 a
month bill -- so dropped them.

So had go to elsewhere and it costs me $40 a month x 12 = $480 to get the
web space I need and the bandwidth.

Then you run into the problem of some nut banging on your website
automatically and drivng the bandwidth out of site.

Mabe you meant juno.com -- but you can't run a big website on Juno or
zero.net or those guys.

I've got one of my Hickok LS 15874 L2 Cardmatics going. I cleaned, lubed and realigned the switch matrix as well as other switches and also found a cold solder joint from a previous repair. About 100 of the switch matrix pins had what looked like old paper capacitor wax on them, very sticky! I took all the pins out, cleaned each one and the sockets. (An ultrasonic cleaner would have been nice.) It took several attempts to get the clearance correct, since the jam nut moved but I finally figured out a system. Now it appears to test tubes just fine but it still has one problem that escapes me and wonder if anyone would have any ideas. It responds per the manual to all test cards except card 9, Gm, Low Ib. About half the time card 9 will kick power off and I'm guessing it's because the meter kicks backwards below zero when button 2 is pressed When it doesn't I can adjust Low Ib per the manual and seems to work fine. However sometimes the meter needle doesn't go below zero enough to kick the power out but when this happens the Ib control has no effect! Any ides or tips appreciated.

The RBF-1 is nothing more than a simple SWR bridge, with an RF
voltmeter for 'power' calibration.

There should be just a couple of pots for the two ranges off of the
forward power diode in the bridge, via the slide switches on the back.
nothing more.

If you want a good accurate wattmeter, this isn't the unit. It was
only guaranteed to +/= 20$ accuracy. As long as you had a good 50 ohm
load you were okay. Any SWR would make it read way off.

I'd sell it. There are plenty of SB-303s out there needing homes. In fact, for what that kit will sell for, one could buy a couple SB-303s, take them apart, replace all the parts that are somewhat iffy, and rebuild. That is, if what you really want is an SB-303 in the first place.

Me, I'd rather have a K2/100 if I'm going to have a kit solidstate rig.

The problem is somewhat like that of having a valuable bottle of wine - its value reaches the point where drinking it is more of a symbolic act. And only when it's open will you know if the experience was worth it.

Odd as it may seem, I'd rather see it left unbuilt, to preserve how the kits were packed.

--

AFAIK, the record for an unbuilt ham kit on eBay is still held by one of the *worst* kits they ever made. Some years back, a sealed unbuilt AT-1 showed up. It was dated 1956, which made it one of the last AT-1s sold. Box was unopened for more than 40 years. Bidding was brisk, to say the least. The AT-1 originally sold for $29.95, but that one went for $5100. Not a typo - five thousand one hundred dollars.

I have the following items for sale that are excess to my needs. Prices do not include shipping. I will ship overseas.

Heathkit Laboratory LG-1 Signal Generator.....$50 plus shipping
This is the higher end signal generator from the 1960ï¿½s with shielded compartments and better performance than the lower end Heathkit signal generators. Covers 100 kHz to 30 MHz in 5 bands with both CW and modulated CW functions, a step attenuator with steps in microvolts, adjustable modulation and jacks are for external modulated source No manual but they are available from several sources. Tested and works fine.
http://members.cox.net/radiostuff9/heath_labgen.jpg

Heathkit QM-1 Q-Meter.....$100 plus shipping
Rare Heathkit QM-1 Q-Meter. This unit is from around 1952. This instrument is for working with resonance circuits to determine L and C and frequency. The unit works and includes a copy of the manual.
http://members.cox.net/radiostuff9/heathqm1.jpg
http://members.cox.net/radiostuff9/heathqm12.jpg

Knight CB Checker Ten-2 CB Checker.....$125 plus shipping
This is an interesting Knight piece from the early 1960ï¿½s. Has the following functions: SWR, % modulation, Field Strength, Crystal activity, monitor, signal generator, Code Oscillator (on a piece of CB test equipment?), audio oscillator. This is a collector quality unit with original box, manual and all original paperwork.
http://members.cox.net/radiostuff9/knightcbchecker.jpg
http://members.cox.net/radiostuff9/knightcbchecker2.jpg
http://members.cox.net/radiostuff9/knightcbchecker3.jpg
http://members.cox.net/radiostuff9/knightcbchecker5.jpg

Lafayette HB-76 VHF Receiver.....$35 plus shipping
This is a VHF receiver from the 1960's that covers 152-174 MHz. The unit is in excellent condition cosmetically and does work.
http://members.cox.net/radiostuff9/laffvhf.jpg
http://members.cox.net/radiostuff9/laffvhf2.jpg

Eico 717 Electronic Keyer.....$50 plus shipping
This keyer was designed to match the Eico 753 transceive from the 1960's. The keyer needs some work. The unit comes on and works momentarily and than dies which would indicate a defective component or tube. Includes a copy of the manual.
http://members.cox.net/radiostuff9/eico_keyer.jpg
http://members.cox.net/radiostuff9/eico_keyer2.jpg

http://members.cox.net/radiostuff9/eico_keyer3.jpg

Signal Corps U.S. Army Test Set Frequency Meter Test Set I-129-Bï¿½ï¿½ï¿½.$100

plus shipping.
Military set of James Millen wattmeters covering 1.5 to 40 MHz. Case
manufactured by Hickok . Excellent condition
http://members.cox.net/radiostuff9/wavemeters1.jpg
http://members.cox.net/radiostuff9/wavemeters2.jpg
http://members.cox.net/radiostuff9/wavemeters3.jpg
http://members.cox.net/radiostuff9/wavemeters4.jpg

ZM-3A/U Capacitance Analyzer.....$75 plus shipping
Nice unit, works well, new power cord. Insides look like new. Don't have

a manual , however they are available from several sources on the
internet
http://members.cox.net/radiostuff9/zm32.jpg

Book - "The Portable Radio in American Life" .....$25 plus shipping

This is a 260 page book published in 1991 covers the
history of portable tube radios and transistor radios from the 1920's to

the 1970's. Includes historical information on Sony, Zenith radio,
Admiral radio and many other brands who built portable radios. This is
an excellent reference book if you collect portable and transistor
radios. These are new books. This is a great radio reference book. I
have 2 of these books left.
http://members.cox.net/radiostuff9/portableradiobook.jpg

Set of crystals for the Navy TDQ transmitter...$75 plus shipping
Their are 24 crystals of which 23 (a few duplicates) are the original
Navy crystals; one crystal is not. The wooden box is in great shape
also. Here are the frequencies all in MHz: 5.80,12.90,13.10, 13.26,
13.50, 13.74,13.75,
13.82, 14.02, 14.02, 14.30, 15.62 ,15.64, 15.66, 15.68,15.78,15.84,
15.85, 15.86,15.86,15.86,15.92,15.92, 16.00, 16.24

Drake ML-2 Marker Luxury 2 Meter Transceiver.....$60 plus shipping

This 1971 2 meter transceiver has a solid state receiver and a tube
final putting out 10 watts plus. Also has a built-in AC/DC power supply.

This one is in nice condition and works well. This one has the original
crystals for 34-94, 94 Simplex. For more info on this radio visit this
link: http://www.dproducts.be/Drake_Museum/ML2.htm

I told you if you moved those jam nuts at the bottom of the reader
you'd have fun! Have you replaced ALL of the electrolytic caps? Caps
could be the cause of what you are seeing. Plus--seems like there is
also an adjustment for the sensitivity of the circuit breaker in the
machine. There are something like 50+ cards to calibrate the
machine--went through all of those?

Chris

Nah, certainly someone who paid that much understands the
"investment value". Do a websearch for "catalin radio" for
shocking valuations. Also see those "Antique Roadshows", where
hideous junque goes for ten times that and more.

I caught one last weekend, they had an "1800's American Indian
carrying pack for babies". It was made of a couple horse blankets
and had yarn woven into a diamond pattern, $50,000 or more. It
looked like a couple old horse blankets that someone had trimmed
with coarse yarn. Ugly.

There was also a painting of an old house. Looked amateurish
but supposedly done by a "famous artist". Gag me with a J-38.

I turned it off. It was too much to take.

That AT-1 is *cheap* at $5,100.

1) It is a early relic of a technological age that will never, ever
come again. The homebuilt tube radio era when kids saved their
milk-money to buy magical communications devices.

2) It is a Heathkit. The Heath line was an anomaly in the ham
world. A few genius engineers put technological marvels in
"everyman's" hands. I remember the awe of putting my DX-60

together in 1963 as a 16 year old.

3) It is an "unbuilt" kit. As others have said, there are lots of built kits available but the "unbuilts" are the rarest of the rare.

I started restoring boatanchors a couple years ago when a hand surgery went bad. Scared my doc, he could see the liability suit. I have no (ZERO) interest in sueing someone for drawing bad cards, luck of the draw. He told me to work my fingers as I had never worked them before to regain manual dexterity (this is after we were sure I wasn't going to lose the hand.)

Turns out that refurbing boatanchors is fun, almost as much fun as building the DX-60 or that incident with "Trixie-Lee" when I was 18.

I've updated my boatanchor site, start at www.kiyoinc.com/heathstuff.html and follow the eZine/BLOG.

Chris
I am guilty of not heeding your advice on the jam nut but it was not intentional mistake, it was the result of several attempts to get the parts back together. But a dope slap imigh tbe in order. I'm very impressed with engineering, design, and manufacture of the switch. Except for alignment, I don't see any need for improvements. I'd guess the facctory had a jig for aligment. I used a 13/64" allen wrench as a "feeler guage" after I determined what clearance was necessary to make sure all pins were out and how much they needed to go down so the female contacts would snap in the grooves of the pins. It took hours but the next time it will be quicker!
As far as the 54 test cards, I can't get proper readings on 1 thru 5 as my Cal. Cell is dead, or Card 9 but the rest are in spec! For the calibration cell Alan Douglas's book shows a 4.7 volt Zener while the USM-118 website has a 5.1 volt Zener and I'm trying to find out if the difference is important.. I think I may attempt to recharge the Cal. Cell mercury battery with my constant current source and see what happens.
The tube socket voltage and resistance readings pretty much agree with the data in the manual. All the electrolytics pass on my Dick Smith ESR meter.. I'm a rifleman not a shotgunner when it come to caps unless there is evidence that most of the caps are suxpect because of manufacturer or age. Besides, I like to know what component caused the fault. Next I think I'll let the unit hot soak for 24 hours and look at it with a scope.
It passes the breaker tests fine so I don't think relay needs adjustment. Since the Card 9 problem is not always repeatable it's difficult to pinpoint. What happens on Card 9 is sometimes the meter tries to go below zero and sometimes it kicks the unit off. I'm still trying to figure out how this Gm balance bridge circuit works. I've colored a set of schematics with Card 9 switches activiated and trying to get thru the maze to see if I can pinpoint the fault.
All that being said the Cardmatic is one hell of a design for a tube checker! I've got to get it going because I hve hundreds of tubes to check!
Any all tips appreciated.

Don't! At best, it won't work, at worst, it will explode. The mercury
cell is a one way reaction. It cannot be reversed.

Been there, tried that, blew it up!

It's fixed, a new day respite helps. Previously I noticed that the component board had been removed at some time becasue I could see signs of resoldered wires on the non-component side. (At that time I found a cold solder joint on R231.) I thought perhaps a wire had come off or someone transposed some. Being lazy I got the high intensity light out and thought I could see if there was a problem without taking the board out, there's only 4 screws! But before doing that I thought I'd recheck the 10K ohm Gm bridge resistors, pot and as I was connecting my Fluke to the10K resistor lead I could see it was wrapped around the post but not soldered, same for all of them. Eureka and happiness, good light helps. I took a pix and posted it at alt.binaries.pictures.radio. I soldered 4 ends and now it works like a champ and checks a known good 12AX7 as good. No more meter slamming backwards on Card 9 or power kick off and the Lo Gm pot works per spec. After more careful inspection I could see where others have tried to repair this one because I could see other signs of soldering and component replacements, some not so good. Since it was like this from the factory, it had to have been continually intermittent and became a waster of gravity. Anyway I'll be it didn't get much use and I think the condition of the switch matrix with all the waxy stuff was becasue it was sprayed trying to solve the no solder problem. This one is Serial No. 703 so if you have one near that you might want to check R 402, 403, 404, and 406 for no solder!

This was a very interesting post Henry, I have one of these and it seems to be working OK. I have everything except the cal cell is dead. I would like to see a pic of those jam nuts that you shouldn't touch if possible as I thought about cleaning the card reader.

Update on the Swan 260 -

On the advice of a kind ham who wrote to me, I have replaced the
final tube (6LQ6) and now have about 100 watts on the three lower
bands. Seems when the 1 ohm resistor (that I replaced) burned it
took the tube too. But there's lots of carrier when you key the mic, so the
carrier balance is off. At least it again has lots of RF output!

Hi,
The calibration cell simply verifies that the meter is 100
microamps and a total of 250 ohms. And it contains the limit resistors
for the leakage test. I wouldn't worry about it.

Incidentally I wouldn't use any silicone lubricants on the
card-reader pins. While the original organic grease has stiffened with
time and needed to be replaced, it was probably carefully selected to
do its job. On the Cardmatics I've repaired, I've used a grease
originally supplied to General Radio by Oak, but I have no idea where
to get more of it. It was described to me by the GR engineer who gave
me some, as "Beacon M325" grease.

I don't know if the buyer ever built it - there was no indication of
what
he intended to do.

> Nah, certainly someone who paid that much understands the

Yep. What happens is that an "object" stops being what it was designed
to be (a table, a lamp, etc.) and becomes "art", and its price becomes
whatever people want to pay, regardless of its utility as what it was
designed to be.

That show is kind of a "guilty pleasure" for me. I like seeing
ordinary folks suddenly discover that something they have is
worth big bucks.

Two favorites:

Two ladies bring in what looks like a Tiffany table lamp. They'd had
it for years, and the local antique dealers said it was worth maybe
$200 because it
wasn't a real Tiffany lamp. They *knew* it wasn't genuine because the
base was
metal, and Tiffany only used wood.

The AR expert, however, said it was indeed genuine Tiffany, because in
the
early 1900s there had been a few lamps made with metal bases. Six were
known
to survive - the ladies' was the seventh, and none of the others were
in as
good condition. Expert said the lamp was worth at least $120,000. The
two
ladies had simply taken it off the end table and brought it to the
show in
a cardboard box. Their *house* wasn't worth $120,000.....

Then there was the couple with an antique table. Cost them a few
hundred.
Ugly with a capital ugh. Expert said it was very rare, perfect
condition, yada yada yada. Worth at least $200,000 at auction. They
nearly capsized; they'd
been using it as the place to dump the mail and car keys when they got
home
and in the door.

So they put the thing up for auction at Sotheby's. Of course with the
show
it had lots of publicity. $100K. $200K. $300K. $400K. Bidding finally
stopped at somewhere around $490,000. For a little old table.

> That AT-1 is *cheap* at $5,100.

As art. As a transmitter it's not worth $51.

>

> together in 1963 as a 16 year old.

The AT-1 was probably their *worst* transmitter. Which is forgivable because it was their very first. I had a DX-20 - very good little rig.

One of their most amazing feats was the HW-16. In some ways it was the very best Heathkit ham rig ever made, because it gave a Novice *exactly* what was needed, at a low low price. Good CW receiver and Novice gallon transmitter in one box with sidetone, TR switch, etc. Nothing else needed but a key, speaker, antenna and xtals. No frills but no shortcomings either. For a nickel less than $100.

Another was the SB-200. Table top amplifier that would do the then-legal-limit on CW and 1200W on SSB. $200 when it first came out. Its bigger brother, the
SB-220, was only $359.

> 3) It is an "unbuilt" kit. As others have said, there are lots of

> www.kiyoinc.com/heathstuff.html and follow the eZine/BLOG.

That is one heck of a site! Love the descriptions! And yes, in basic radio performance the new rigs are not much better than much of the old stuff.

A thought for all:

With some basic tools and test gear, plus a bit of skill and patience, one can collect an SB-line, clean it up and have a
pretty decent ham station. 40 year old technology but still very useful
and fun.

Will the hams of 2044 be able to do that with today's ham rigs? Or even the
hams of 2024 with the ham gear of 1984?

I recall the PS 22 folk (WB2JKJ?) in NY doing this for the past 20-30 years. I have no problem with them soliciting junk gear then selling off the surplus to support a legitimate radio club.
I mean, really. How many old wattmeters and keyers can a club use? The person donating gets their write-off and kudos...the club gets to pick thru the best of the lot...and the remainder goes back to the market to pay the lights and rent for the club.
Could easily be a scam but thats not my first assumption. If you've ever managed the finances for a radio club you'd know how it works. You're not gonna find many 10-12 year old newbies to pay $25 per year club dues just trying to get themselves involved in the hobby.

For noisy TV tuners back in the 1960s when I was working in a Radio and TV shop we used Lubriplate white grease that came in a small black and grey tube that resembled travel toothpaste.We sprayed the wafer switch in the tuner, rotated several times and then applied a light coating of Lubrplate with a small stick and rotated several more times. On turret tuners we cleaned the pads and wipers with contact cleaner on a Qtip and then applied Lubriplate. This was in Norman, Okla where the humidity played havoc with tuners making them intermittent and after the treatment we never had call backs. Somewhere I have a partial tube of this stuff but haven't located it as yet, so I used DeOxit on the Hickok switch matirix but would have used Lubriplate if I found it. After about more than 20 moves there's lots of possiblities where it is. Two local auto parts stores didn't have anything but silicone grease which I haven't used except as a heat transfer aid on power transistor heart sinks. I think that Lubriplate would be a good lubricant/protector unless there's something better that I don't know about. I'm guessing that there's something better after 40 yeats and would be interested in what users have used>
Now to repair number 2!

I snipped all the stuff about "investment vehicles" because that topic doesn't interest me as much as a good rig.

Like many I have scaled back due to my flagging interest in hamming. My wonderful but worn out IC-745 went the way of ebay and I started hunting for a good old CW boatanchor setup that most suited my needs...basically 40/20 CW and tube type. (antique radio restoration is my other hobby)
I went thru a bunch of various pieces and all were nice but had shortcomings in one way or another. External power supply, external antenna relay, too bulky, too tempramental, futzing around with wannabe sidetones and mutes and so forth.
Thought about homebrewing but had a hard time justifying the expense vs satisfaction for my casual operating.
I landed on the HW-16 (and a VFO) for less than $65 total and I'm happy as a pig in mud with it. I converted 15m to 20m....well, that popped me 20 more bux for the xtal. It may be a cheap little rig but it does everything right for me even after being a ham for 30+ years and DXCCing 300+ countries.

Hi all,

I just found several 829B tubes - believe it or not in my garage - I must have got them in a box of stuff at a ham fest at one time. A check on Ebay shows they're pretty much worthless for the sake of dollars, but they're so COOL! With the two plate caps that are actually just stiff pins, they look like little Martians.

I put a pair on my office credenza just to look geeky cool. Fresh out of the box as NOS they look amazing - just like they were made yesterday. It's a pity they have no value - maybe as a homebrew project??

So can someone tell me what they would have been used for? Something tells me they're a VHF power tube.

Any application as a one-tube QRP rig of any sort? Any stories about using them in the past? I've built a lot of little rigs over the years, but never knew about the 829

Thanks,

Dave

The last rig I saw using an 829 was about 35 to 50
watts in the 50 to 70 MHZ range.
Makes a good 2 Meter amp.
Nice tube. Not QRP IMO...
I have three of them around here somewhere.

They are WWII military tubes. As you surmised, mostly for VHF
work. The smaller cousin was the 832B tube, used in the
SCR-522 transmitter (driver, PA stages). A very popular conversion
for 2-meter AM through the 50s and early 60s. The modern
version of the 829 is the 5894 power tube.

also replying to WX4A.

I've never used one but I think a Triton IV would be a better rig
for me. I like 20 meter SSB and contest style operating. I've
looked at the HW-16, they do look like a nice package.

I like to be able to tune around all the bands even though I've made
very few contacts other than on 20 and 40. An HW-16 wouldn't do it
for me. An SB-102 or SB-104A might do the trick.

Funny I should comment on this as I haven't operated on HF for
years. I've been listening and have been refurbing my radios.

Just got some Anderson PowerPoles. That'll let me organize my 2
meter gear and the Battlebot. The same 12 V gelcells that run the
'bot also powered my laptop when Hurricane Izzy knocked out my power
for 5 days. I also got the 3/16ths phone plug that'll let me hook
a mike up to the Signal/One.

They are about the same as a pair of 6146 tubes in one envelope but are more efficient at higher frequencies.
Good for about 100 watts out at 2 meters and somewhat ueuable at 440 mhz.
I think the old VHV book had an amp in it for 144 mhz that was rated for about 40 watts out on AM and more on CW/SSB.

Motorola used them in the "K" strip series of transmitters....60 watts at 150Mhz. Usually driven with a 2E26. That tube with 700 Volts on the plates would make that kind of power all day...Eddie

You've gotten some good responses from some others in the NG.
The most unusual application for the 829B that I saw was their
being used to drive the magnetic-core memory modules in the
Whirlwind I computer racks on display in the Computer Museum
in Boston. The sockets may have originally been designed for
832's and "upgraded" to 829's for more drive or longer life.

they are 2 ea 6l6 tubes in 1 envelope and were used for a lot of vhf
transmitters you get 40 to 60 watts in a class c fm transmitter.

|years, but never knew about the 829

I used one on two meters in the early 60's. The amp was of course push-pull and had a tuned line plate circuit with link coupling. I ran AM and CW and used the modulated high voltage out of my Heathkit DX-100 for plate and screen voltage.

The original exciter was a converted SCR-522, which used the 829's baby brother, the 832 as frequency multipliers and final. Later I replaced the 829 with a 5894 and the 832s with a baby version of the '94, whose part number escapes me at the moment (6907 I think).

These later tubes were more efficient at vhf and were tetrodes rather than the 832-829 "beam-power" tubes. The 832 was sort of like a pair of 2E26s sharing a cathode and the 829 was sort of like a pair of 807s.

Eventually, I replaced the clunky '522 with a more compact exciter out of the Handbook that used somethin' or the other as oscillator/doubler/tripler and a 6360 tripler driving another 6360.

Real progress came when I converted the second 6360 to a high level mixer driven with a Central Electronics 10A SSB exciter. (I don't even want to think what the IMD out of this mess must have been.)

Many thanks to all who replied, both here and by email.
They sound like a great tube for LOTS of purposes. My
favorite suggestion was building a regen, using each
half in place of the 6AQ5's called for in the ARRL handbook
design from the 50's!

How about an oscillator / amplifier for HF, running low
plate voltage for a relatively low RF output? Seems they
should be able to do that - and having a separate oscillator
stage it wouldn't be prone to runaway and exessive crystal
current. And it would look VERY cool!

What sort of plate caps were used? There are just pins, and
it looks almost as if there would have been a ceramic gizmo
like a tube socket to have bridged the two of them....

Again, thanks for the info!!

Dave

To see the tube photo -- go to googe.com type in "829B tubes"
Select IMAGES not web.

I recall these in Military Aircraft of the 50's --- I believe ARC-27 -- a
UHF Transceiver by Collins Radio

The ARC-1 Transceiver used a smaller rounded version 832B -- we called them
door knob tubes -- see google

So would make a VHF/UHF power output stage maybe 10 watts or so

They were the final in the TX of the AN/ARC-3, too. I never got
mine lit up, as I went into the USAF not long after I got mine --
surplused (or something) from the Civil Air Patrol, way back in
1964.

On the transmitter for the AN/ARC-3, the plate leads just had push-on clips with a little bit of spring-loading, much like the contacts in a tube socket.

A nice article starting on page 40 of the August, 1949, issue of QST
describs a two-tube (6AG7 oscillator [26MHz xtal]/doubler and 829
amplifier) for 75 watts output in the 6-meter band.

I was looking at doing something like that years ago, using a homebrew
output transformer, but I never finished it. I do know that the 829
was used in some of the modulation decks for aircraft band transmitters
at one point, so they should be fun at AF.

If I recall, the 829 is one of the tubes with the cathodes tied
together to a single pin, isn't it? This reduces the utility for
such things.

They are little ceramic clips. You can use Molex pins in a pinch.

882. FS: PSC-10 Hammarlund Speaker for HQ-129X

Newsgroup: rec.radio.amateur.boatanchors
Date: 2004-02-06 20:16:29 UTC
From: Michael Melland <w9wis@charter.net>
Message-ID: <1027memnlq5im5a@corp.supernews.com>
Source record: 25840

I have a nice PSC-10 / SP -10 speaker for sale. This is the fairly rare (I'm told) matching speaker for the HQ-129X. The speaker is in nice shape with no dings, dents, or gouges. It's paint is thinning a bit here and there as it does and someone quite picky probably would over spray the black wrinkle finish. The thin spots look like they are rusty in the pictures I have but it's really not rust.... no pits or rough spots.... just some discoloration.

The speaker appears to be all original.... has the original speaker and still has the feet on the bottom. I attacked a speaker lead myself. I had been using this with my HQ-129X but recently sold it. The speaker functions as it was designed and sounds great !

I'm asking $60 shipped to the lower 48.... if I don't hear of anyone wanting it by late this afternoon it's off to that auction site. Pictures here:

Hello everybody,

I've updated the list of the Drake R7A raffle. You'll find it at
http://home.online.no/~sindtorp/raffleDraker7a.htm

74 of maximum 150 tickets have been sold so far, so you still have the
chance to get yours.

If you believe this is legit, then I got some land I want to sell to
you.

I'll also toss in an original R1155 receiver that was actually used
by 617 squadron in the dambuster raid. This radio is original, in mint
condition, and complete. Except for the DF circuitry...

:)

Source record: 25752

I am going to recap an old Hallicrafters. I have some Kester sn96.3 ag3.7 solder. Can this be used on joints that already have old lead solder on them? I'd like to get away from lead products, but don't want bad solder joints either. Is this new Kester solder a good replacement for lead solder on new projects? Any advice appreciated.

Been enjoying the spirited bidding on August Link's eBay Command set rarities as well as the equally spirited debate regarding the morality? of it all. Good theater if nothing else. If they go any higher someone in China will start making counterfeits.

I scoured a lot of surplus places in the 60s and although I have memories of literally tons of unused ARC 5 gear, I never once saw even one of the rare sets he found. As late as 1975, Standard Surplus on Market St in SF CA would give me a free NIB ARC 5 xmtr with every $20 purchase if I politely asked Abe, the crusty old owner. He had big stacks of them in the rat infested dungeon like basement. Getting a box with knaw marks was part of the experience. The good old days.

Thanks,
Mark

Lou
Under the black cover over the matrix swtich there are 3 black bakelite slabs (3.5" X 4.5" X ~1/4") with 187 holes sandwiching 185 pins. With the black cover removed (2 screws) and the card plunger pushed in and you'll see that the sandwich "floats" on four 8-32 threaded posts. Each of these posts has 2 nuts sandwiching the slab sandwich. The position of the lower 4 nuts (I called these jam nuts) determines how far in the 185 pins go into their female counterpart where there is no hole in the card. If there's a hole in the card the pins must not make contact with their female counterpart, and this clearance is about the thickness of a dime. In addtion all these jam nuts must be on the same plane so that the sandwich is orthagonal and will not bind so it can move smoothly.
A pix would have been easier but the batteries are being charged. Let me know if you still need a pix.

That's right on! The rig was the Collins ARC-1. It used one in the final and one in the modulator. The thing was for 100-156 MHz. Later conversions for the airlines in the late 40's added 50 or so channels (sort of like the ARC-3 and the ARC-49).

I've tried the "new" solder and as far as I'm concerned, it isn't worth spit on electronics. Kester still makes the old stuff and says they will continue to do so, esp for the electronics industry. I did, however, acquire one of those smoke vacuum filter units for the bench. I used to just hold my breath when the plume of smoke went by...hi! I'm a bit more high-tech now!!

Good luck with your find! I have one and enjoy it, very much. The SX-73 was the first in the R-274 line. Hammarlund beat them out with the SP-600, as you already know. Hallicrafters must have been in a hurry on that contract. There are some curious design items and the tech manual has some errors in matching diagrams with text, so look for that. Looks like nobody did the proof-reading. My R-274 came with the original covers and tools but someone had removed the dial brake. Too bad, too, it sort of mucks up the front panel. I did a bit of re-capping, but it wasn't as bad as some rx's of the same vintage. Alignment is not too difficult. The light bulbs on the chassis are for ballast/regulation... not trouble shooting lights....hi!! The band-switch turret can be a bear to work on and are prone to break. Unlike the SP-600 (R-274B, etc.), the turret design on the SX-73 is not robust, so to speak. The contact fingers are quite delicate.. so be mindful of bending them, too. The tuning gears may need cleaning and adjusting. The tuning knob should be free and be able to spin, just bit, when its in good working order. Books are easy to find and you will need one, absolutely. Hopefully, also, your unit will have the original S-meter. There was a Signal Corps replacement for it (black face) that can be found. Regarding the S-meter, read the fine print in the manual. Unlike most other receivers, the s-meter in the SX-73 cannot be zeroed. One sets the meter for a known input level. When no signal is present, on a quiet band, the meter will negatively pin and, then, move upscale with signals present. The book makes notice of this fact, so don't try and make it zero. The power connector is an older style 2-prong, recessed male ac plug.
That's about all I can think of, at this time. Regards and, again, good fortune with your unit. de K3HVG

No, that stuff also takes MUCH higher temperatures. Just use 63/37 stuff.
Lead solder is fine. There's no lead in the fumes, so as long as you wash
your hads after handling it and keep the work surface clean, you won't have
any worries.

There are still a lot of them out there, and they are fun project rigs. Not
so useful stock, but they were cheap (and many models still are), and are useful
as starting points for homebrew stuff.

FS Nice Drake TR5 Transceiver and matching Drake PS-75 Power Supply.
This is very clean gear cosmetically. It looks almost new. It does works,
but needs a good alignment. Receiver sensitivity is low. Calibration is good
and the digital readout is bright and clear. Everything works. I have made
several contacts and get good audio reports. It puts out around 90 watts, a
little more or a little less depending on band. The rig includes the
original manual and all cables. Price is $875 plus shipping. Digital
pictures available. Thanks, Charlie Hugg, K5MBX

Dave, as I recall there was a design in one of the ARRL books..... maybe VHF manual that included an 829B. I also recall Motorola using this in a very old radio, don't remember exactly. Anyway I think it's good for 40-50 watts. I wouldn't mind having them if your looking to part with them.

The datasheet is here:

http://www.mif.pg.gda.pl/homepages/frank/sheets/049/8/829B.pdf

A lot of The Radio Amateur's Handbooks of the '50s and '60s had 892B projects in them. The 1953 edition, immediately to my left as I write this, has "A 100-Watt RF Amplifier for 50 and 144 Mc." on page 405. It runs push-pull class-C, up to 120 Watts CW or FM, and 100 Watts AM.

And the following fellow has gone to an awful lot of trouble to use two 829Bs in parallel single-ended triode mode in a stereo amplifier:

http://www.pmillett.addr.com/829b_amplifier.htm

Anyone shed any light on the "Heather Lantern" for me please ?
I have pictures on my web site, but almost no info.
Was it used in convoy work in the 1940s ?
All info will be greatfully received.

My 2c.
I was working at a job site and had to do a few days of repairs to some
older gear while there. Since I was without my own tools they supplied
me with a soldering pencil and some of this solder.
I thought it handled well and for what I was doing I didn't notice the
temperature issue but nor did I have any 63/37 to compare to.
It made very nice shiny connections with ease and my only gripe would be
the fumes which are wicked, at least they were with whatever brand it
was that I was using.
I've heard about the pending doom where anything with the letters
L-E-A-D right down to fishing sinkers will be outlawed and don't have an
opinion on how this might effect electronic solder. My one brief
experience with the sn/ag stuff leads me to think that plain old sn/pb
is going to remain as a favorite by popular vote if for no other reason
than the fumes created by the 'safer' alternative.

Thanks Henry, I see what you are saying. The pins come up to about an 1/8' from the top of the plate. One thing I just noticed, there is no pin in the 17A position, bottom left corner spot. I wonder if mine is missing or it was made that way?

There's 187 holes with 185 contact pins. A17 has a threaded guide post that sets the gap (about a dime) between the two female connectors that the pins connect when there's no hole in the card. H17 doesn't have a pin nor does it have the lower female solder connection, I guess they didn't need it. Perhaps when someone has or will find a need for the 186th pin we'll have to find an extra pin and a lower female contact and a place to route and terminate the wires.

I have an Eico 710 Grid Dip Meter unbuilt in the original box with
original manual. Everything appears to be there including an Eico flyer
for some of their other kits. This is from the mid 1960's

$400 plus shipping

I'd think running the 829 in parallel for a HF PA, with another
829 as a P-P modulator would be a neat project.

Who would want a multicoupler for 1-500 millihertz ("mHz")! If you can't
use abbreviations properly, you shouldn't use them at all. Get a MHz!

Lots of discussion about using the 829 for VHF power amplifiers, and even audio amplifiers and conversation pieces. But I haven't seen mention here of their use in pulse generators. I have a TS592A/UPM15 pulse generator that uses one in its output stage (not all my test equipment is very new ;-), and one of the early uses of them was as a driver in "hard tube" radar pulse modulators, developed fairly early in WWII. They were used in "Model 3 hard tube pulsers" for example, where the two sections were run in parallel, outputting well over a kilowatt during the microsecond long pulse, 0.1% duty cycle. The very similar 3E29 also get lots of mention in early radar pulser history. Perhaps someone knows: was the 3E29 an 829 re-designed and/or specifically tested for use in pulsers? What was the 829 originally intended for, and when was it first introduced? Who made the first ones, RCA or someone else?

Cheers,
Tom

Hello all.

this could be a Dow relay if not it looks like dow.this relay also has an external relay. i did put 115 volts to the coil and the relay did pull in [closed].it looks to be in good condtion. $30.00 plus shipping in the US.

thanks,Garry

Don't have answeres to all those questions but the 3E29 had a "better"
cathode to handle
the peak current requirements..

: A lot of The Radio Amateur's Handbooks of the '50s and '60s had 892B
: projects in them. The 1953 edition, immediately to my left as I write this,
: has "A 100-Watt RF Amplifier for 50 and 144 Mc." on page 405. It runs
: push-pull class-C, up to 120 Watts CW or FM, and 100 Watts AM.

Gone by the 1955 edition I have. The 1947 ed uses it in 3 2M TX circuits.

I have 3 RCA 829B and 6 or 7 slightly sturdier UK mil CV2666 equivalents,
plus some CV178A / 5894 bottles I intend to use sometime in something:-)

: And the following fellow has gone to an awful lot of trouble to use two
: 829Bs in parallel single-ended triode mode in a stereo amplifier:
:
: http://www.pmillett.addr.com/829b_amplifier.htm

These (Chinese) stereo push-pull amplifiers are commercial products:

http://www.cayin.de/amps_de/endverstarker/929D/929D.htm
http://www.cayin.de/amps_de/vollverstarker/500/500mk.htm
http://www.cayin.de/amps_de/endverstarker/800mk/800mk.htm
http://www.cayin.de/amps_de/endverstarker/800/800.htm

They substitute Russian FU29 or GU29 or US 3E29 in some.

You can get a rough translation by copying & pasting
http://translate.google.com/translate_c?hl=en&u=
in front of the links, with no space between the two.

These seem to be out of production now by the manufacturer;
they used to be on the vaccum tube amplifier link from their English index:
http://www.sparkaudio.com/eproduct.asp

RdM
(operators certificate in 1969 at 17 - never actually got on air - one day!)

I wonder if lead tin solder will become like Freon 12, still in demand but now 15 dollars or more a can instead of 99 cents just a few yrs ago. Maybe its time to stock up on few rolls of old style solder before it becomes a hoarded overpriced item.

Hehe...I did that a couple years ago and now have a bunch of old stale
solder :-) I'm one of those nutty people who notices that "out-of-date"
solder just ain't as good as fresh.
My understanding is that lead based solder has been nixxed for plumbing
work already and I suppose that makes some sense. Dunno if that gave
rise to the rumour that electrical solder would suffer the same destiny.
Does anybody know for sure?

There used to be a *relatively* popular surplus rig that used three of
them. I remember they were lined up and as I recall the final had a
tuned line output link coupled to the antenna.

Don't remember what it was called. That was nigh onto 40 years ago.

No major Cellular Carrier would pay that price for one. It would cost too much to contract someone rip out the junk and then modify the building for their use.

Don't trust the "Blown when lit" lamp for the DC Filament fuse. Don't ask me how I know because that's my fault, hi hi.....A tip that might help before attempting to clean the switch matrix that worked for me and saved some time was to insert an unpunched card into the reader and excercise it several times. The reader won't slam as positively because it forces all the pins to make contact. Next I found that 2 unpunched cards will barely fit in the reader and 2 cards will make the pins go a little further in and help clean a bit more of the shaft and their female counterparts. It slams even less positively with 2 cards but it saved me from having to diassemble the matirix. One question I can't answer is how long it will last but time will tell.
I'd like to know if anyone out there is interested in swapping me a military manual or copy of the AN/USM-118B for a copy of my KS-15874-L2 manual?
Also I'd like to know if anyone has a spare aluminum case for the Cardmatic that they might sell?

Pardon me if I'm boring you with my Cardmatic trivia but I'd like to know which of the 4 sites I posted to has most cardmatic users?

Pic 6: the top left and bottom right gear is a pair of R-1051
receivers, exact model uncertain.

Pic 7: bottom gear is another pair of R-1051 receivers.

Pic 15: 6 of the eight items in the middle two rows are R-1051s.

Pic 19: three of the items in the left-hand rack appear to be some
flavor of crypto gear.

I see 390's 1051's, nixie tube counters, scopes, patch panels, signal gens of all sorts, I think a TMC exciter(not sure), I think a spectrum analyzer or pan adapter, multicouplers/filters, papertape stuff, modems (TUs), audio recorders and controls, what look like amps, time code generation and readout equipment, test sets and I guess the crypto stuff which I know zilch about.

If the pics were organized and higher res I could tell you more detail (as could many on this list).

Or CRT drivers (in the AN/APS-44 aircraft radar, and I think some of
the Navy PPI repeaters).

> Perhaps someone knows: was the 3E29 an 829 re-designed and/or
> specifically tested for use in pulsers?

Probably. 3E29 was used in the Mk III IFF interogators, circa 1943. I
don't know of any other major uses for the 3E29 (AKA 829A). Real 3E29s
are getting quite scarce, but 829Bs still can be found in biblical
quantities.

> What was the 829 originally
> intended for, and when was it first introduced? Who made the first
> ones, RCA or someone else?

1943, probably RCA, although National Union was apparently an early
second source. 832 was the model for the 829.

I've seen references to the fact that the 829B was used in MIT's Whirlwind computer as core memory drivers, definitely a pulse application. I don't have any documentation on that, but I do remember some dual plate 829B-like tubes in the Whirlwind fragments that used to be on display at the now-defunct Boston Computer Museum. They could have been 3E29s, though, or even 832s.

The Univac I used 829Bs, as documented here (5/8ths of the way down the page):
http://ed-thelen.org/comp-hist/BRL61-u3.html

With that complement of tubes you could make one heck of an all-modes transceiver!

Hi,

The 3E29 may share a similar appearance, and the same pin out as the
829, but it certainly is not interchangable. To quote the RCA TT5
manual:

3E29: Heater-cathode type containing two high-perveance units used
as retangular-wave pulse modulator. Modulator Service maximum
CCS plate dissipation (per tube) 15watts.

Further down, it shows the plate supply voltage as 5000V, and the
instantaneous plate voltage as 5750V.

829: Heater-cathode type having midtapped heater used as af power
amplifier and modulator and as rf power amplifier and oscillator.

CCS dissipation is shown as 30W with natural cooling, and 40W with
forced air cooling.

It is pretty clear to me that the 3E29 was rearranged for high plate
voltage, and was used as a radar modulator tube. It is designed to
put out high voltage square waves.

After 10 years I can't recall if my Hickok Cardmatic LS-15874-L2 or AN/USM-118A or B cards were ever returned or what. My remainder set is not compplete and I wonder if anyone has a set or partial set for sale. I'd also like to know if anyone has figured out an economical way to duplicate them at reasonable cost? Did Hickok make them or a contractor, anyone from Ceveland know?
On another tangent I wonder if anyone knows of any solenoids that are small enough to install on 0.25 inch spacing. With 185 of these, using extended matrix switch pins one could control the switching with a PC. I wonder if anyone recalls seeing some device that uses small solenoids that are small enough and cheap enough to homebrew a matrix. I know that this plus more has already been accomplished with relays but at $1000.00 the mod is unjustifiable for me.
Another alternative would be to have a "crossbar" of 11 by 17 rods or slats with each one driven by a solenoid, requiring the a row and column solenoid to be driven to select a pin. Having a solenoid at each end of the rod might balance the operation. This would require 28 solenoids or double that if one is needed at each end. These could be spaced on 1/2 inch centers by staggering.
If anyone has a better idea please me know but the best would be to find an orphaned set of cards.

There's a big push to stop putting lead solder into landfills, particularly in Europe. They tried making manufacturer's take their stuff back but it didn't work, so now they're trying to eliminate lead from solder.

I suspect that there will be quite a long grace period where the military, avionics and medical systems people will be able to continue using lead solder on reliability grounds.

Does solder really get that stale? I'm still using the roll I got 25 years ago as a gift (it's a big roll) -- I don't have any problems with it, nor does my boy, 10, who's just learning to solder.

Perhaps you could pack it with dessicant?

The solder doesn't get "stale", the flux does.

Easily fixed with a bottle of flux.

The push to eliminate lead has nothing to do with it getting "stale". It
is considered to be a toxin that effects intelligence (although according to
Emsley, the chemistry community is not sure about some of the research to
that effect - kinda' like the mercury scare).
There is a big push to eliminate Lead in everything including electronics.
Major elec. manufacturers are already working to reduce it wherever they
can.

RE: "stale"solder:
If solder is left in a humid environment, possibly with oxidants such as
sulfur as well, it can degrade. Generally, the "duller" it looks, the worse
its condition. I don't know the chemical reaction(s) (both tin and lead are
generally quite un-reactive) , just that some solder from the 1940's (like
in Dad's garage) can be "dirty" on the outside. and difficult to use. I
would keep it in sealed plastic bags.

Chuck Harris <cfharris@erols.com> wrote:
in rec.radio.amateur.boatanchors<4027a0eb$0$3196$61fed72c@news.rcn.com>,

: Hi,
:
: The 3E29 may share a similar appearance, and the same pin out as the
: 829, but it certainly is not interchangable. To quote the RCA TT5
: manual:

Hi, Chuck. "Certainly" is a strong word. In this case, I'd take issue with
your conclusions from those pages of the RCA TT5 manual ... see below:

: 3E29: Heater-cathode type containing two high-perveance units used
: as retangular-wave pulse modulator. Modulator Service maximum
: CCS plate dissipation (per tube) 15watts.
:
: Further down, it shows the plate supply voltage as 5000V, and the
: instantaneous plate voltage as 5750V.

Emphasis on "Modulator Service" for both of those paragraphs ...

: 829: Heater-cathode type having midtapped heater used as af power
: amplifier and modulator and as rf power amplifier and oscillator.
:
: CCS dissipation is shown as 30W with natural cooling, and 40W with
: forced air cooling.

For Class C Telegraphy (and only natural cooling & CCS shown at AF)
De-rated plate voltage and input 89% above 250MHz. Different services.

However, compare the transconductance and mu factors - identical, as are
heater requirements, and as are the three interelectrode capacitances given
- almost; G1 - K, G2, G3, heater mid-tap is 14.0 vs 14.5pf.

It is not inconceivable IMO that "Bill K7NOM"'s assertion that the 3E29 had
a "better cathode" might explain a 0.5pf difference, and that an otherwise
very similiar tube might be derated 50% in plate dissipation for pulse duty.

: It is pretty clear to me that the 3E29 was rearranged for high plate
: voltage, and was used as a radar modulator tube. It is designed to
: put out high voltage square waves.
:
: -Chuck Harris

Given the identical transconductance and mu factors, mostly/almost identical
interelctrode capacitances, and (I assume, not having seen one) similiar if

not identical external appearance in construction, I don't think it could have been "rearranged" very much. I'd hazard a guess that they *are* interchangeable, at least downward, (ie 3E29 anywhere you'd use an 829B) if not 829B for pulse duty. Perhaps they are the same within 829B ratings?

Furthermore, the 1962, 1955, & 1947 ARRL Handbooks I have all list 3E29/829B together, with ratings on the same lines, and G1/fil capacitance as 14.5pf. The latter two also list 829 and 829A, separately, from 3E29/829B together.

It's actually comparing transconductance, mu, and interelctrode C's (let alone typical AF Ra-a figures) that led me earlier to entirely reject loose statements like "they are essentially two 807's (or other) in one bottle".

IIRC, there have been mentions elsewhere that RCA may have labelled identical tubes differently for different services. I think Ned Carlson of Triode Electronics said something about this on rec.audio.tubes once, but I can't find it on a brief look. IOW, marking as different for marketing ...

Here's another suspiciously similiar example from RCA TT5. You know that 6883 and 6159 are identical with 6146 except for heater ratings. Now have a look at 6293 and compare the above factors (& outline, base, etc) with 6146.

Identical, *except* that it's listed for pulse duty, and "Rectangular-Wave Modulator maximum plate dissipation, 10 watts." (ie half, as per 3E29/829B)

What's the bet that you could use a 6293 anywhere to replace a 6146? :-) Vice versa? Is it possible that RCA labelled tubes for different markets?

Maybe the pulse tube versions (if they were such) of otherwise standard transmitting tubes had somewhat better emission or other cathode tinkering for the very high (though short duty) pulse currents; perhaps they were pumped out longer for a harder vacuum; - I speculate, but there do seem to be a few cases where they appear identical (except for pulse plate diss.) with different numbers. IIRC too, there are some tubes with both pulse and normal ratings I've seen data for, but I can't remember any offhand - it would be interesting to compare the plate dissipation for both duty classes.

Cheers!

Ross Matheson

Hi Ross,

It certainly could be that they are very similar inside.
I have used the 829B, but I have never had my hands on a 3E29.

Purely speculation on my part, but I would guess that the 3E29 has
fewer sharp edges inside to help prevent arc over and other funny
stuff at the 6x increase in plate voltage. I would guess that the
cathode is made of much sterner stuff, and the vacuum is purer.

They make a special point of saying that the 3E29's mu will always
be within 10% of the spec'd value. That tends to indicate that more
care was taken with internal tolerances, particularily cathode to
control grid spacing.

The part I find odd is usually when RCA is listing a similar tube
they will say something like plate curves match 6L6, or some such.
There is a total absence of mention of the 829B in the 3E29 spec
sheet.

What do you want to bet that the 3E29 also cost 3x the 829B?

Anybody have a 1950 price sheet?

-Chuck Harris

Evening all,

This is a good question. I too have a LS-15874-L2 that came with the small deck that supports only Western Electric tubes and have thought about seeing if I could get new blanks made so I could program my own tubes as needed. Has anyone done this in the past? If so were the cards usable?

$51 not enuf for an S-METER?

better re-list and hope for $350, which is clearly what an S-meter
is worth - maybe $500, but that might be pushing it....

Chuck Harris <cfharris@erols.com> wrote:
in rec.radio.amateur.boatanchors<40283c62$0$3200$61fed72c@news.rcn.com>,

: Hi Ross,
:
: It certainly could be that they are very similar inside.
: I have used the 829B, but I have never had my hands on a 3E29.

Ditto. (Well, I haven't actually *used* them yet - they're still NIB! :-)

: Purely speculation on my part, but I would guess that the 3E29 has
: fewer sharp edges inside to help prevent arc over and other funny
: stuff at the 6x increase in plate voltage. I would guess that the
: cathode is made of much sterner stuff, and the vacuum is purer.

I have seen mention of harder vacuum and tolerances in pulse-rated tubes.

Ned, in a 1997 r.a.t post, compares a pulse-rated 4PR65A to a 4-65A, itself already having a higher vacuum than your average receiving tube, and notes that the latter wouldn't sub for the former. [http://tinyurl.com/3c5wx] Elsewhere he mentions 4-400A and 4PR400A. Eimac numbers, I think.

: They make a special point of saying that the 3E29's mu will always
: be within 10% of the spec'd value. That tends to indicate that more
: care was taken with internal tolerances, particularily cathode to
: control grid spacing.

Quite possibly. I hadn't heard the 10%. Top of the bell curve selection?

: The part I find odd is usually when RCA is listing a similar tube
: they will say something like plate curves match 6L6, or some such.
: There is a total absence of mention of the 829B in the 3E29 spec
: sheet.

Exactly my point with the 6146 equivalent examples, all from TT5.
All listed as sharing 6146 data except for that very alike pulse tube 6293.

Yet, again, the ARRL Handbook data section has 3E29/829B sharing.

That German audio retailer with the Chinese amps has them using 829B, 3E29, or GU-29, implying AF similiarity. There's a clear picture of the GU-29 at: http://ly1dq.hypermart.net/gu-29.htm (and a simple 2M TX example at http://ly1dq.hypermart.net/exam/gu-29_01.gif , to stay slightly on topic:-)

: What do you want to bet that the 3E29 also cost 3x the 829B?

(:=}) Quite possible, since military or other radar the likely application.
Plus it likely wouldn't do to say "Just use our 829B, it'll work fine" ;-)

They must have at least been "selected" or perhaps built to better specs.

It wouldn't make sense to be building an essentially identical tube too
differently. A subtly different cathode coating, perhaps, for the different
pulse current requirements? (like starting batteries vs storage) (total
speculation on my part!) and a longer time on the vacuum pump would be easy
to arrange on the same production line, with the build otherwise identical.
Perhaps harder vacuum plus statistical selection alone would be enough?

Ah! I've been scrolling through my files, and found some text on 829B/3E29
I'd saved from the Joenet archives (someone building an amp with one or two)
in which Gary Longrie says "Same tube, but the 3E29 is pulse rated, can hold
off 5kv, being built with ceramic parts."

I don't know how true this is ...

I notice that the UK mil CV2666 has a completely extra top mica disc above
the plates, extending all the way to to the glass, with ceramic inserts, as
well as the bottom metal disk with ceramic inserts like the RCA 829B.

It just occurred to me to do an image search on 3E29. Sure enough,
http://www5b.biglobe.ne.jp/~tritium/rca3e29-1.jpg
http://www5b.biglobe.ne.jp/~tritium/rca3e29-2.jpg
http://www5b.biglobe.ne.jp/~tritium/rca3e29-3.jpg

http://home.snafu.de/appelt/tubes/3E29.jpg

It looks the same as the RCA 829B that I have here, as far as I can see.

Hmm. http://hereford.ampr.org/cgi-bin/tube?tube=3E29
-
"Maximum Ratings (Design Center Values)

Plate Voltage ..... 750 Volts
Grid No. 2 Voltage ..... 240 Volts
Plate Dissipation ..... 40 Watts
Grid No. 2 Dissipation ..... 7 Watts

For other characteristics and typical operation, see 829B"

–

http://www.r-type.org/exhib/aaa0174.htm shows 829B (& "=" 3E29)

Commentary mentions the superior European double tetrodes, which

"made the 829B and 832 obsolete, and offered greater output power.
This valve type would not have been the valve of choice by 1950.
Currently, designs exist to use all of the VHF double tetrodes as audio
amplifiers, these are physically beautiful devices and deserve to be seen."

: Anybody have a 1950 price sheet?
:
: -Chuck Harris

That would be interesting, too.

RdM

[obviously with too much time on his hands right now, but likes his 829B!]

Oddly, after all my previous post, I hadn't looked at an RCA 3E29 spec.
This old one (TT?) from 1946, does say " Similiar to type 829-B, but
intended particularly for pulse modulator service."
http://www.mif.pg.gda.pl/homepages/frank/sheets/049/3/3E29.pdf

Still unclear on what makes the difference, though.

:
: On the transmitter for the AN/ARC-3, the plate leads just had push-on
: clips with a little bit of spring-loading, much like the contacts in a
: tube socket.

In the RSGB Amateur Radio Handbook 3rd Ed. they went so far (full construction details) as to give details of a drilled and tapped (for grub screw) 3/4" x 5/16" brass rod, for QQV06-40 / 5894 (has thicker pins)!

You might consider using the brass inserts from terminal connector blocks, which already have grub screws and come in at least a couple of sizes.

Since the anode tank circuits then often used flexible copper strip to possibly more brass rod in these British circuits, a bit of heat-sinking would be taking place as well, I think. May as well use a heavy contact.

The 829B needs external neutralising, unlike 5894 with it built-in.

I could scan the few pages of the 1947 ARRL I have showing 829B, but you might want to find the few years following for more, maybe improved ones.

Just remember that the Invader 2000 is basically a SSB transmitter,
and not plate modulated AM if you use it in that mode. It probably
takes one sideband (maybe both sidebands) and injects carrier to make
an AM like signal.

I envy you. The Invader 2000 was the object of my amateur radio
dreams when I was 16 years old.

Can't argue with the above but my memory says that the high currents in
pulse duty could strip
material from the cathode. The pulse rated tubes had a more robust
cathode. That was a long

time back so can't be sure of my facts at this time

But then, they look in a buy and sell newsgroup idiot.

It's bad enough that ads are allowed here in the first place, but you
abuse this when you feel your need to sell something makes it okay
to advertise something unrelated to boatanchors in this newsgroup.

Just a warning to anyone thinking of posting replies to posts like 'Beyond a wholesome discipline' and several other that are appearing in every newsgroup. They all have a message beginning with La Site Communiqu&#65533;.

If you 'reply to group' your email will be immediately added to their list, and you'll get an email saying you are now on their list, and they say you agreed to it! Some new coding trick that detects you posting a reply, then scams your email address.

Just thought someone might want to know. Do NOT post a reply to these unless you don't feel you're getting enough spam yet.

Dave

This could be an easy restoration for someone. It DOES work - there is audio, and it hears it's own birdies. But it doesn't receive any signals, and the preselector never peaks. Has all the band crystals. Has the calibrator, but is missing the crystal for it. Case has some stenciled lettering on top, a grease pencil 'Set Number 4' above the meter, and a small scratch near the tuning dial. Very shiny chassis and no mechanical mods that I'm aware of. See photos at: www.enw.cc/2c1.jpg for the front and www.enw.cc/2c2.jpg for the rear. $65 plus UPS from 98466 Sorry, but no manual.

Thanks - email if you have more questions. - Dave

There is already an excellent computerized version of the Cardmatic
available by Signal Systems--Phil Frakes. This machine apparently
works very well and is in use by SND Tubes and AES. So--no need to
reinvent all of this--plus the software is done for you. You can have
your tester converted to this system by Phil and then no cards are
required. I believe he has something on the web about the machine.
The conversion is not cheap, but you are talking about a major amount
of wiring and relays. Plus--a full set of Cardmatic cards is worth
over $500.

I do have a complete card set, and have made a few cards for
people--one hole at a time. This just is not practical. My hand
gives out after two cards. Wendell Hall has a friend with an original
Hickok fixture for punching the cards. I'd like to get that fixture,
but Wendell says the guy won't part with it.

I'm aware of the computerized unit at
http://www.tubesontheweb.com/index.htm, but it's out of my range. Is there
any way to find out what the fixture looks like, better yet a pix?. Now I'm
wondering if an old IBM keypunch card maker could be the base. I can't
recall the model number., but there was no shortage.of them 40 years ago but
I'll bet you could find one cheap if you looked hard enough.

I recently found a stack of NOS manuals that appear to have been purchased without the kit as the insides are clean and unmarked. Prices do not include shipping.

I will ship overseas.

Heathkit RX-1 Mohawk Receiver Manual - NOS.....$75 plus shipping
Insides are excellent and the 10 foldout drawings are there. The back cover has a small stain in the lower left hand corner and a bit of shop ware. Date on manual is 1959.
http://members.cox.net/radiostuff9/heath_mohawk.jpg

Heathkit Tuner Assembly Manual - Mohawk RX-1.....$75 plus shipping
Insides are excellent and the 2 foldout drawings are there. The back cover has a a bit of shop ware. Date on manual is 1959.
http://members.cox.net/radiostuff9/heath_mohawktuner.jpg

Heathkit 2 Meter Converter XC-2 Assembly Manual.....$65 plus shipping
Insides are excellent and the 8 foldout drawings are there. The back cover has a a bit of shop ware and their is a small stain on the lower left bottom of the front cover. Date on manual is 1959.
http://members.cox.net/radiostuff9/heathxc2.jpg

Heathkit DX-40 Transmitter Manual - NOS.....$75 plus shipping
Insides are excellent and all of the foldout drawings are there. Cover has a bit of shop ware from so many years of storage. Date on manual is 1958.
http://members.cox.net/radiostuff9/heath_dx40.jpg

Heathkit AC-1 Antenna Tuner Manual- NOS.....$50 plus shipping
Insides are excellent and the 2 foldout drawings are there. The back cover has a a bit of shop ware. Date on manual is 1957.
http://members.cox.net/radiostuff9/heath_ac1.jpg

Heathkit MT-1 Cheyenne Mobile Transmitter-NOS.....$65 plus shipping
Insides are excellent and the 4 foldout drawings are there. The back cover has a a bit of shop ware. Date on manual is 1959.
http://members.cox.net/radiostuff9/heath_cheyenne.jpg

Heathkit SB-10 Single Sideband Manual - NOS.....$75
plus shipping
Insides are excellent and the 4 foldout drawings are there. The back
cover has a a bit of shop ware. Date on manual is 1958.
http://members.cox.net/radiostuff9/heath_sb10.jpg

Heathkit HW-19 Manual 10 Meter Transceiver.....$65
plus shipping
This is the ten meter version of the lunchbox (Twoer). Insides are
excellent. The back cover has a a bit of shop ware. Date on manual is
1960.
http://members.cox.net/radiostuff9/heath_tenner.jpg

Heathkit DX-20 Transmitter Manual - NOS.....$75 plus
shipping
Insides are excellent and all of the foldout drawings are there. Cover
has a bit of shop ware from so many years of storage. Date on manual is
1958.
http://members.cox.net/radiostuff9/heath_dx20.jpg

Heathkit CO-1 Code Practice Oscillator Manual.....$20
plus shipping
Insides are excellent and the 1 foldout drawing is there. The back cover
has a a bit of shop ware. Date on manual is 1959.
http://members.cox.net/radiostuff9/heathcpo.jpg

Heathkit HD-19 Hybrid Phone Patch Manual.....$22 plus
shipping
Insides are excellent however their is a small bit of water damage in
the lower left bottom of the pages. None of the page are or were
sticking together The back cover has a a bit of shop ware. Date on
manual is 1958.
http://members.cox.net/radiostuff9/heath_patch.jpg

Heathkit AM-2 SWR Meter Manual-NOS.....$22 plus
shipping
Insides are excellent and the 1 foldout drawing is there. The back cover
has a a bit of shop ware. Date on manual is 1959.
http://members.cox.net/radiostuff9/heathswr.jpg

Heathkit B-1 Balun Coil Manual - NOS.....$22 plus
shipping
Insides are excellent. The back cover has a a bit of shop ware. Date on
manual is 1957.
http://members.cox.net/radiostuff9/heath_balun.jpg

Non-Manuals

Heathkit Catalog - Winter 1985.....$10 plus shipping
Very good condition.
http://members.cox.net/radiostuff9/heathkitwinter1985.jpg

Heathkit Catalog - Winter 1975.....$10 plus shipping
Very good condition.

http://members.cox.net/radiostuff9/heathkit1975winter.jpg

"The Portable Radio in American Life" Book.....$25
plus shipping
This is a 260 page book published in 1991 covers the history of portable tube radios and transistor radios from the 1920's to the 1970's. Includes historical information on Sony, Zenith radio, Admiral radio and many other brands who built portable radios. This is an excellent reference book if you collect portable and transistor radios. This is a new book.

The old IBM key to card punches that I have seen (and scrapped) were
the model 19 and the model 29. They were small steel desks full of
mechanical and electrical parts that no one wanted, so they were
scrapped for the steel frames and made into small work benches.

I have never seen the punching fixture, but think it consists of a
number of punches with a plate and die that matches the plates in the
tester. Punches are added or removed, depending upon whether a hole
is to be punched in a certain location. When all punches are in place
the (guessing) lever is pulled and a cam drives the punches through
the card into the die. Even this method is pretty darn slow. You
would be working for a long time to make up a set of thousands of
cards. Now there was a guy selling some cards on Ebay a year or so
back--he was in California. I don't know if he has any cards left.

better make that a model "026", and "029". There was also a model "129".

the 026 and 029 were distinguishable by the _round_ keys that stuck up from
the keyboard, like a forest of dowels. The "129" had a contemporary-looking
keyboard. with a grid of square keys.

>mechanical and electrical parts that no one wanted, so they were
>scrapped for the steel frames and made into small work benches.

I don't know anything about the cardmatic, but if it uses a 'standard'
Hollerith-style punch-card format 'card', then I know where _lots_
of "surplus" card-maker devices would be available. _Everywhere_ that
governments used "punch-card *VOTING*MACHINES*". You could even make up
a 'ballot form' that had a crib-sheet on it for what each hole in the
card meant. <grin>

Not exactly a boat anchor, but I picked this up at an estate sale and am wondering if anyone can give me some info. It is tagged "Diplomatic Security". Coverage is 2 kHz to 10 gHz. Includes what looks like a spectrum analyzer which also doubles as a T.V. all mounted in a small suitcase. Any info would be appreciated.

Cool.

Betcha it's a bug-sweeper. The spectrum analyzer adds some points to
that pobability. If you ever want to get rid of it, I have a place
for it.

This is just an old CB set with a little TV attached to it so you can watch the Ball Game. It's probably only worth about ten dollars but I'll be a good guy and offer you twenty. Heck I'll even pay the shipping.

995. RAFFLE OF DRAKE R7A; updated list

Newsgroup: rec.radio.amateur.boatanchors
Date: 2004-02-12 10:26:53 UTC
From: Sindre Torp <sindtorp@online.no>
Message-ID: <AxIWb.3334$_c4.47482@news4.e.nsc.no>
Source record: 25656

Hello everybody,

I've updated the list of the Drake R7A raffle. You'll find it at
http://home.online.no/~sindtorp/raffleDraker7a.htm

78 of maximum 150 tickets have been sold so far, so you still have the
chance to get yours.

Thanks for your support!

Sindre, LA6OP

998. Re: What use is an 829B tube?

Newsgroup: rec.radio.amateur.boatanchors
Date: 2004-02-12 22:31:16 UTC
From: Biz WD=?ISO-8859-1?B?2A==?=HCO <wd0hco@ev1.net>
Message-ID: <BC515AD4.C006%wd0hco@ev1.net>
Source record: 25659
Cross-posted to: rec.radio.amateur.boatanchors,rec.radio.amateur.homebrew

Well to answer the replacement question - according to GE Industrial Tube Products Guide - (Dated 9-79)

You can replace an 829 with an 829B.

You can replace an 829A with an 829B or an 3E29.

You can only replace an 829B with another 829B.

Why? I don't know, that's what GE says.

Now what an you use an 829B for? Well I got one, it was a spare from a GE 6m Prog Repeater our club had on the air. The replaced it with a nice Moto. The Prog was up for grabs but no one wanted it and was about to be hauled to the landfill so I took it.

It lasted about two days in my house working fine. Then I put it out of it's misery and parted it out. It had lots of juicy power transformers, tubes and sockets, XTAL holders and so on. Most ended up in other projects or repaired rigs except for the 829B.

What to do with it ???

I decided to build a one tube 40 Meter CW transmitter.

Nothing special about that - all of us have built 6L6's or 117L7GT, 6V6, 6C4, 6GW8 or you name it peanut whistlers. Nothing more than an oscillator connected to a string (antenna) blasting out a few watts.

But how about a SINGLE tube transmitter pumping out 100 to 115 Watts !!!

With minimal parts count to boot!

I got the idea from QST - June 1940 (page 26) in which Fred Sutter W8QBW describes a transmitter using -TWO- 6L6's in push-pull supposedly outputting 100 watts to an end-fed Zepp.

I'd take the 100 Watt claim with a little grain of salt... but it's still not too shabby for 12 parts and 2 tubes not counting the power supply.

The 829B can replace the two 6L6's and the circuit can be adjusted accordingly. The output tank circuit will be PI instead of link which was common back then. I also have a nice power transformer that looks like it can do 700 mils at 750 VAC so I have plenty of head room to crank out more power if it can handle it and the XTAL doesn't shatter.

I'll use forced air cooling because the 829B socket is already designed for it. Was gonna go with a fancy blower but I noticed the XYL is not using the

small Dirt Devil handVac I gave her for her birthday. Will cut a small hole in the chassis and placed a PVC pipe and attach the air hose to that. RCA Manual says the MAX glass temp is 235 F so hopefully, the plastic vac can handle it.

For a Glass Chimney, I took a drinking glass and cut off the bottom with a glass cutting wheel. I was rinsing out the dust in the sink when she spotted me. I told the XYL I had just taken out the glass from the hot dishwasher and poured a little bit of cold water and the glass cracked and the bottom fell out. I hoped she didn't notice the ends were nicely smoothed.

You should have seen her face. Classic...

It's the same look I get when I bring in another hamfest surprise and promise it's the last radio I'll ever buy because my radio collection is complete - excuse.

Well anyway - A single Tube 100 Watt CW Transmitter - that's my 829 project.

Have all the parts - now waiting for the weather to warm up so I can get to work in the Garage.

You just know if she sees that tube chimney and her Dirt Devil, I might just have to sleep there too.

-Biz WDï¿½HCO

I posted a picture of my 829B on alt.binaries.pictures.radio for those who have never seen one.

I'm still looking for a '160. I have all the rest of them, from the 120 and up (sans the 100 and 110 which I never liked). I think the 150 and 160 sound better than the 180!. But , I'm thinking of what you may want-need? I'm a B/A collector, I don't "do" other than comms gear, typically. Interested in an almost out-of-the-box Zenith 7000U Transocean. (think that's the model #), never had batts in it? What else.....? Or... perhaps a cash buy?

From: k3hvg <jeepp@erols.com>
Message-ID: <402C1B17.DD0059B7@erols.com>
Source record: 25663

I just parted a very nice NC-183. I don't need the case (top, bottom, rear, front panel/side panel assy. Its in altogether excellent condition, no rust, perfect markings, etc. The only bugaboo is that it has an extra hole (yeah... I know.. you were waiting for that!!!) just above the stby switch. I have to say, however, that with a trim hole-plug in it, it looks fine! It really does. If my '183 case were not of the same condition, finish wise, I'd change it out in a heart-beat. I also have most of the innards, also in excellent condition, The dials are entirely usable if yours are cracked or unreadable. Reason for parting and not restoring? Parts I needed to bring mine up to museum quality and this one had no power xformer and was "modified" for I have no idea what. The complete S-meter and mtg assy is also available. $50 for the complete case w/ postage. Offers for other parts. Regards and thanks for the read.

I am puzzled. I thought that the value of mobile collection was to be able to intercept VHF/UHF comms that couldn't be picked up by land-based intercept stations. Other than a few possible CEI VHF/UHF receivers in the left hand rack in (I think) PIC14, all the receivers shown are HF. What gives?

Also, the R1051, with its one-digit-per-knob frequency control, is a poor receiver for search. The R1051 is much better suited to fixed-frequency intercept of mainline and other upper echelon comms links. These links are usually easily intercepted by land-based operations, so why bother with them on a mobile collection platform like the Pueblo?

I have for sale within the continental US, two
Powerstat Variable Autotransformers commonly called "variacs".
See description below. Check or M.O. accepted.

$40 each + shipping from 07042.
If interested, please contact me stating your zipcode for shipping cost.

Thanks for looking.

-Al Schapira, KC2HRH, a.d.schapira@worldnet.att.net
==========
Powerstat Variable Autotransformer, Type 3PN116B,
50/60 ~, 1 ph, 120 VAC in, 0-140 VAC out, 10A, 4 ft 3-wire line cord,
3-prong standard receptacle, on/off switch, 10 A fuse, "Fisher
Scientific" tag on body, used, working, very clean. About 11 lbs.

Maybe the R-1051s were for stuff like fleet broadcasts, order wires,
and the like, so the Pueblo could talk with next higher and with the
ships that were getting part of Pueblo's "take" via HF or VHF from
the Pueblo.

Maybe they were there for getting PDRK trunk comms where the PDRK
transmitter used directional antennas and the beam didn't go over
anyplace that Daddy Dirnsa could put a land station?

Or maybe they were getting the back lobes of a transmission?

I have at last some of the tubes I have bought over the past years organized
and priced.
I looked up prices from the regular tube dealers, including AES, and priced
my tubes mostly from 30% to 40% less.
These tubes will only be sold through the web site, www.muchstuff.com .
Please don't ask me if I have any particular tube, the only tubes that are
for sale are those on the web site, but I will be adding more tubes often.

Here are A VERY FEW examples:

VERY OLD TYPES :
UV-201-A USED, BRASS BASE, GLASS TIPPED, GOOD $20.00
UV-201-A DUDS $11.00
UX-201-A USED, BALLOON, GOOD. $12.90
2A3 USED, GOOD. $26.90
226 USED, BALLOON, GOOD. $9.90
45 GOOD, ST $19.90
99 LONG PINS, GOOD. $19.90
WD-11 LONG PIN. GOOD FILAMENT, OTHERWISE UNTESTED $29.95

LATER TYPES:
1DP1 NEW. $60.00
5AR4.GZ34 NEW. AMPEREX/BUGLE BOY. $29.95
5U4G USED, GOOD. $6.50
5U4G NEW. $9.70
6B4G NEW. $24.90
6D6 USED. $1.00
6D6 NEW. $2.95
6GH8A NEW. $1.95
6H6 NEW. $1.00
6JS6C NEW. $25.95
6ME6 NEW $23.93

and, I can accept VISA, M.C., PayPal, checks and money orders.

If UPS Ground is the only available shipping option then thats understandable due to their limited coverage. But via the US Post Office its no more expensive to send an item from NJ to Alaska/Hawaii/PR/APO or Micronesia than it is to California and if the buyer is paying then why the restriction?
Sorry for the rant. I just encounter this so often and when I inquire the answers range from "too much paperwork" to "no problem, you're paying the postage". Maybe its just an old 48-stater habit to say "continental US"

I think some people have a problem filling out the little green customs declarations. In any of my Ebay sales, I've never sent a package to PR. Though a territory / US Commonwealth, I don't know if one is required or not. However, I'll ship any non-restricted item world-wide. After all, the buyer pays the postage.

I bought several years worth of "Radio Constructor" magazines from a guy in Britain some time ago. His initial post on ebay.uk said that the offer was good only for shipping within the UK. I emailed him stating that I'd be willing to pay whatever the Royal Post rate was to get these shipped to the US. He agreed, and postage was about three times the cost of the auction. It was worth it to get these magazines though. The Sir Douglas Hall construction articles are truly classic!

Try calling it a "Relay Rack", and check with surplus stores or scrap
metal yards.

I have three nice ones from scrapped Stromberg-Carlson telephone
systems sitting here, but I'm in Florida. i also have two deep ones made
from aluminum, with nice rounded corners that had small PDP-11 computer
systems in them. Sometimes you can find them at a radio or TV station
where older equipment was replaced, and they emptied a rack. I have
about a dozen different sizes, from portable, to six foot units, on
casters that are full of test equipment and power supplies. The most I
paid for any of them was $75 for a rack.

The reason is that most of us are geezers and have forgotten that
Hawaii and Alaska are STATES and not foreign countries.

PR, ditto, same postal system; same currency. As an AH6 license
holder, I still get questions on, "what's Hawaiian money called?" or

"Do they speak English?"

You would think that between "Hawaiian Eye", "Hawaii 5-0", "Magnum P.I." and "Baywatch Hawaii", and a half dozen other shows that it would sink in.

The only difference between shipping to Hawaii and, say, UT, is the two character state code.

Why would you need to fill out a "little green Customs form" to send
something within the US? Thats what I'm talking about...people don't
seem to know what is included in their own country.

Fedex and UPS Air often require filling out a "Commercial Invoice" form
for Puerto Rico because they, at a corporate level, don't consider PR as
part of the US for convenience because of the local taxes that are
imposed on certain imported items. More importantly that distinction
gives them the right to charge international rates rather than domestic.
Last time I bought a used car in SC and registered it in NC I had to
pay local tax but I didn't have to present a Customs Declaration.

> Pic 15: 6 of the eight items in the middle two rows are R-1051s.

> Pic 19: three of the items in the left-hand rack appear to be some
> flavor of crypto gear.

More info on Pic 19 (<http://users.erols.com/eengineer/096f_17.jpg>):
the three identical items stacked together on the left
side appear to be KG-14 cryptodevices, from the picture of a KG-14 at
<http://webhome.idirect.com/~jproc/crypto/kg14.html>.

The arrangement of the thumbscrews that hold the box in its case
is pretty distinctive, and the fuseholders just below that box
sticking out of the front panel do, I think, pretty much cinch the
identification.

I'm looking a big metal "Raytheon" emblem from the front
panel of one of their ancient AM broadcast transmitters.
I don't care which model it comes from, but the bigger
the emblem is, the better. It must be in nice physical
condition. It's okay if it needs to be repainted.

The postal laws can be confusing. In my neighborhood, there are several people with family in the Marshall Islands. MH - the two letter state code, is a protectorate, but not a territory, though they do use US postage, have a ZIP code, etc. Yet you send a parcel to "MH", I understand a customs declaration is required. MH has a "V7" amateur radio prefix, as well as "V7" for their commercial broadcast stations. It seems that MH is an independant country, but with heavy ties to the US for the country's security and operations.

Customs did pay a visit to my ship while I was in the Navy after we returned from PR to the US Mainland. Likely, they were just checking on alcohol, which import amounts are restricted without paying extra taxes.

I would like to buy a Curtis Keyer. These were made during the early 1980s. They were usually sold as a kit, consisting of a PC board about 1 1/2" x 3", and the IC and parts to populate the board. I have most of these, but have managed to lose the manual. I would prefer to buy the assembled PC board with manual, but if you can help me with just the manual or a copy of it, I would be very grateful.

Thanks a lot,
Jim Chumbley, N6UF

1045. Anyone know power plug wiring for SBE-33?

Newsgroup: rec.radio.amateur.boatanchors
Date: 2004-02-15 03:38:16 UTC
From: Dave Barnett <davencinNO@SPAMtdl.com>
Message-ID: <n4qt20p0rtkt8e3mjno0e8b37qgtp7ksgk@4ax.com>
Source record: 25606

I acquired a really nice Sideband Engineers SBE-33 transceiver and would like to get it working. I already have several SBE-34's and really enjoy these rigs. The problem is that I have been unable to locate any documentation on the '33. Does anyone know if the power plug wiring on the SBE-33 and '34 are the same? I know that with the model 34 there are several jumpers and different wiring configruations that must be made to accommodate 12 volt or 120 volt operation. Does anyone know whether the two models are the same in terms of plug wiring? Any help would be greatly appreciated.

1046. Power plug wiring for Sideband Engineers SBE-33

Newsgroup: rec.radio.amateur.boatanchors
Date: 2004-02-15 03:46:00 UTC
From: Dave Barnett <davencinNO@SPAMtdl.com>
Message-ID: <YXBXb.23863$b75.16989@newssvr27.news.prodigy.com>
Source record: 25607

I acquired an SBE-33 that looks to be in pretty good condition, but has no power cord. Can anyone tell me what the pinout is for the 12-pin connector on the rear of the unit? I have a couple of SBE-34's and could use those power cords, but I hesitate to connect this up to 120 volts without knowing for sure that I won't damage anything.

Any help you can provide would be greatly appreciated.

I have an SX-71 in which I replaced the paper and lytic caps and still have some stray voltage on the chassis. You can get a pretty good shock under the right conditions. It was there before the recap and I thought my resto work would have cured it. What could be causing this? Also notice this on an older SX-16 that hasn't been recapped yet.

From: Chuck Harris <cfharris@erols.com>
Message-ID: <402f812b$0$3081$61fed72c@news.rcn.com>
Source record: 25611

Many radios have a pair of capacitors that go from each side of the
power line to the chassis. They are put there to prevent RF from
coming into/out of the power cord. In the best of conditions, they
put the chassis at 1/2 the power line voltage above ground. That is
low enough not to hurt you, but high enough to make the chassis feel
"buzzy" when you slide a finger across the metal.

Add a 3 terminal power plug/cord to the radio, and connect the green
wire directly to the chassis, and the tingle will go away.

I just got this HP 456A AC Current Probe and need some help to get it going. The 1977 HP catalog indicates that it could operate 400 hours on batteries, not very long for what's in it. The dead batteries that came with it are Mallory TR 236R at 8.1 volts and TR 234R at 5.4 volts, these are C size diameter. There are only two 2N5087 transistors, a diode, and a few resistors and capacitors in the circuit, what's the current draw? I am not sure that these are the correct batteries but would like to know if anyone out there can be confirm the batteries or has a schematic, manual or AC power supply. If I can't find an HP optional AC supply I think I'll build a little Zener stabilized supply after I get the voltages confimred.
tnx

I'll confirm the other post. Looks like C60, a .01 600v cap is from one side of a.c. to ground. I'd certainly suspect it being leaky. If you're going to replace it, why not use a .01 at 1KV disk, instead. Good luck with it... doesn't sound like too much of a problem. I'd recomend that you add a 3-conductor line cord, too. It doesn't detract from the looks and its a heck of a lot safer!!! de K3HVG

...or take those caps out and install a modern line filter somewhere outside of the chassis.

Also, if you do install a third ground wire (which I DO recommend), you won't be able to power the radio on a circuit that is protected with a GFI (Ground Fault Interrupter). It'll pretty much pop the GFI every time.

You are kidding, right? If there is that much leakage current, then the
problem should fixed before adding the three wire line cord. There
is no reason to pop a GFI.

Also, the maximum value for the bypass cap, which should be UL
rated, is about .015 mfd.

I don't see why it will pop the GFI unless the line bypass cap is unreasonably large or something is leaking current. I've done the 3 wire cord modification to a few radios and most of my test equipment, and I haven't had that problem.

Hank,

According to my 1967 HP catalog (in surprisingly good condtion, by the way) the 456A uses two TR233R's and one TR234. It does not list current required (and I guess the 1977 catalog does'nt either.)

My catalog also estimates battery life at 400 hours.

You might search the net for mercury battery current capacity. I seem to recall it is somewhat less than nicads, but I don't remember the ratios.

73,

Phil - N4GWV

Have a Nye Viking MBVA tuner for sale. Some of the lettering on the front panel is "weak", but other than that, it is in excellent condition inside and out. No arcs, burns, worn spots on the inductor, etc. Auto SWR meter works fine and wattmeter tracks with my Autek WM-1 and also auto switches between 300 watt and 3 kw ranges. Have a good photocopy of the manual. Unfortunately, I don't have digital pictures.

Thanks for reading the posting.

73s,

Evan

But when was the picture taken?

There was an article in QST in the early seventies by a crew member of
the Pueblo, who happened to be a ham. He mentioned taking a fire axe
the the R-390s. Someone with a better organized collection could look
up the article (it must have in the first few months of 1971 or earlier,
since I did not read the article when it first came out, and I
started reading QST in April of 1971). So I thought the equipment
was indeed damaged, though maybe they did not have enough time to
do enough damage.

hello,

i am offering the following for sale to hams in the 48 states only. prices are plus shipping. offers accepted. not interested in trades. selling to buy a ten tec qrp rig. wanted to offer to the newsgroup. if it does not sell, off to ebay.

1. Kenwood TS-830S 100 watts all bands. 10 meter portion of band switch needs cleaning. this is the main rig in my shack. comes with cw filter and pc-1a phone patch. copy of manual. $400.00 plus shipping. picture available upon request.

2. MFJ 3 Kw roller inductor tuner. works and looks 100% no longer have an amp. $200.00.

3. Hammarlund hx-50. missing one small knob. needs re-paint. selling in unknown condition. my intent was restoring it, however, you know the deal. too many projects..... you don't see these alot. asking $100.00 plus shipping. worth three to four times that if it is working.

4. knight kit t-60. needs work. $30.00 plus shipping.

5. knight kit r-55a receiver. looks and plays well. original paperwork. $100.00 plus shipping.

reply email. all items sold as is. first come, first served and all the usual disclaimers.

tnx for reading, mike

(Forgot to add this ear;ier:)

: I notice that the UK mil CV2666 has a completely extra top mica disc above
: the plates, extending all the way to to the glass, with ceramic inserts, as
: well as the bottom metal disk with ceramic inserts like the RCA 829B.

Like this Mullard version found on the web; it looks identical:
http://www.tnbstore.com.tw/photo/mullard/mu-829b.jpg

"alll the way to the glass" is not quite precise -
little metal fingers actually contact the glass at the edge.

The article appeared in the February 1971 issue of QST and was written by Ralph McClintock, then K1SCQ - now W1ZK.

The reference to actually destroying gear:

"I didn't realize it then, but in about one hour I could be taking a sledge hammer and fire axe to those R-390As along with all the other juicy receiving equipment on board Pueblo (about five million dollars worth)."

I had clipped and saved his article...glad I did now.

Here it is again. What is it about the states of Alaska and Hawaii
that confuses people.

Both are U.S. States. They use American money. UPS, USPS, and
Fed Ex go there. There are no customs statements to fill out.

USPS charges the same to ship there as, say, California or Nevada.

Anything that will go wrong with a deal to Alaska or Hawaii could
also go wrong with Michigan or Louisiana.

There is no difference between Alaska, Hawaii, and New Mexico or
Maine.

Will someone please explain this 48 state stuff?

What's the story?

Unless something has changed dramatically, the shipping for packages isn't the same at all. The last time I shipped something to Hi many years back (An old Yaesu 560) I was shocked by the amount that it cost to ship. And UPS ain't no bargain to begin with!!

I don't know about UPS and Hawaii but USPS and Puerto Rico follow the
same rate chart as the mainland. Those of us who live outside the '48'
tend to be aware of the costs and if we're the ones paying I don't see
why there should be a limitation by the seller.

I think that sometimes too. :-)
I'm just picky - not saying that 'stale' solder isn't usable, its just
not as good as fresh.

Yes? Buyer pays shipping.

Yes, UPS can be expensive when you use their retail stores or
affiliates but one secret is that there are TWO UPS rates. You can
get a lower rate by shopping around or opening your own account.

USPS charges the same once you hit the max.

But, Buyer pays shipping.

I'm guessing that the aging ham population thinks that Alaska and
Hawaii are still Territories.

Well, I've had more trouble doing deals with Florida.

Thanks to David DiGiacomo I've got the info and it looks like the B+ is 5.4 VDC at 5.5 ma and the B- is 8.1 VDC at 20 microamps! HP used a small centrer tapped transformer at about 25 volts that was regultaed down to the 8.1 and 5.4. I can't find anything on the physical size of the xfrmr but it has to be no bigger than end of ones thumb,but maybe they used a wall wart but I kind of doubt it. I've not had any experience with real small low current xfmrs that take 115VAC to 20 or 30 VAC and would appreciated any ideas on what to use. A wall wart would be my last resort.

For Sale:

Very nice condition Radio Shack DX-160 shortwave / longwave / BC receiver in working condition. Same owner since about 1983. Controls are a bit scratchy and should be cleaned, but otherwise receives well and is very good unmodified original condition. I don't have the manual or the matching speaker. It DOES have the 12volt plug on the rear. Email if you want to see photos.

$60 plus shipping via UPS from 98466

Thanks - Dave

Message-ID: <c0r2ok$t4s$1@newshost.mot.com>
Source record: 25559

I sold my 33 about 3 years ago. If I recall it needs either 120 vac or an external *inverter supply* to supply the fils and High voltage from the external inverter.

In the 120 vac mode it has a 120 volt cord & plug and an extra wire coming out (of I believe an octal)
with an alligator clip. You ground the clip and plug it in the way which has the neon bulb on the rear NOT GLOWING. I believe it must have had a voltage doubler right off the AC line for the HV, but don't remember the filament transformer. It would seem you could easily trace it out. I had the service sheet. I'll try to figure out who I sold it to and get back to you. It was a Prof @ the U of Chicago.

Try looking - asking here:
http://www.qsl.net/la5ki/org/sb/sbe33.htm

Looks like you can get a manual here for $16:

Ok, to make it simple, neither UPS or Fedex do ground shipments to Hawaii,
Air only...

I still want to see that truck..

Have a chicago transformer transformer has 11 bolt type connections. Ohm meter is loaned out at present. The only identfying number is 8456. Im guessing it weighs 15lb or more. I am thinking it is a bias supply transformer. Couldnt find anything on it in the '53 or '58 catalog. believe it to be newer than that.

TIA Jimmie

Source record: 25568

Hi All -

I just have too many radios so I'm making room. I have this Hallicrafters 8R40 which is in pretty nice shape and works. Vintage around 1953. It's general coverage and pretty clean. Probably the worst problem it has cosmetically is some of the labeling on the knobs is worn some and the chrome bezel has some tarnish. Otherwise it's in really good condition. IMHO it's probably around an 8 out of 10.

Because it's a tube receiver and is on the heavy side it would be on the difficult and pricey side to ship so I'd prefer it be picked up. I live in Herrick Center, Pa. 18430, in the Scranton area. Any takers for $75.00 and you come and get it?

Thanks,

Ken

Yes, the 026 had the round keys but the 029 keyboard was basically the same
as the 129 (e.g., square keys).

Not a lot of difference otherwise between 029 and 129 keyboard, although
IIRC the 129 had a pair of LED 7-segment displays (fairly small in size)
which showed the column number [since the machine didn't have a drum card
assembly like the 029 did with the rotating numbered "scale" and fixed
pointer underneath it]. Also, the 129 had a big (relatively speaking)
rotary switch w/plastic knob on the area above the keys themselves to select
which program was currently active.

Oddly, you can get a better rate by having UPS come and pick up your shipment, than you can by taking your boxed shipment to a pack-and-mail shop (but maybe not a UPS store). --Mike K.

Isn't it the rosin flux inside that evaporates or gets stale, not the tin/lead
solder itself?
One old timer taught me to always crimp the end of the solder roll's free end
with pliers when I was finished with a session, to keep that flux from drying
out.

When I was young and crazy and using AC/DC home radios for audio amps, I would rig them with a neon bulb to the chassis, then reverse the AC plug in the socket if the bulb glowed when I touched the free end. I had only one "explosion", on a radio that I hadn't install such a neon tester.

Voltage doublers are tricky -- one common circuit ends up with the common "ground" B- output at a potential different from either side of the incoming power line. If you build a "hot chassis" radio with it, neither position of the AC plug is safe.

There is a voltage doubler circuit (2 diodes, 2 caps just like hte other one) that does indeed preserve the common neutral/ground lead striaght thru, but ISTR it gives a half-wave rather than full-wave output, so needs more filtering.

1116. Help with HQ-160 slot filter and product detector

Newsgroup: rec.radio.amateur.boatanchors
Date: 2004-02-17 06:06:44 UTC
From: knudsenmj@aol.com.Oscar
Message-ID: <20040217010644.07984.00000645@mb-m22.aol.com>
Source record: 25577

I finally got around to working on an HQ-160 I picked up a few years ago. It works well, except the CW/SSB is very weak, and the slot (notch) filter doesn't work at all.

I expect to check voltages around the 6U8 "linear detector" which I assume is a product detector, though how it works is a mystery to me, being just a pentode used as a triode. I know the BFO half of the tube is working, since I can hear it change pitch with the pitch control on an AM signal.

The slot filter is strictly passive components. I've already played with the slug in its coil, and the notch depth control. I just finished working with my HQ-180, so I know how effective this slot filter circuit can be -- and my 160 just has nothing. I hope it isn't an open coil.

TIA for any suggestions -- Mike K. AA1UK

Somehow I missed the original posting, but I have a bunch of Meissner docs here, as well as the "Tru-Fidelity" radio that is essentially the Tarffic Master optimized for hi-fi AM reception (push-pull 2A3s, chrome-plated audio transformers, the works). Same well-known Meissner front end module.

Anyway, I have all sorts of data for the Traffic Master.

Photos would help, but a tube lineup would be even more useful and a lot easier (you can post it. I don't do binary newsgroups).

I've worked on the PD circuit this AM, and it appears the primary of T8 (an IF transofrmer used only to feed the PD) has a non-tunable primary. Since it isn't open, I assume the internal shunt cap is shot.

For now I will just bypass the primary and feed the coupling cap (5 pF) from T7 to the secondary. That produces a CW/SSB audio level comparable to the AM detector's. There will be nothing out the IF Output jack on the rear apron, but I could move its pickoff to the secondary also.

What a shame the AVC doesn't work on SSB/CW. The circuitry is all there to keep it on, but this being a transition-era rx, Hammarlund figured users would want it off. The 170 and 180 got it right!

Haven't got to the slot filter yet. Dreading an open coil (like what else could be wrong?) I've shot the Slot Depth pot full of DeOX-It, no help.

Again, thanks for any suggestions. 73, Mike K AA1UK

I have for sale a KLM 2M-20 LBX 20 element boomer

20 elements on a 38.5 foot boom
15.5 db forward gain
10 lbs.

If you operate 2M sideband, this is the antenna for you.
There's nothing better around.

Price $175 Firm + shipping.

A while ago I got an offer I couldn't refuse for my good TO-6, so I sold it because I didn't need it at the time and I knew I could find another. Well I found two that looked like they had been thru the mill, but for $10.00 for the pair I took them. One works reasonably well, while the other has more problems. I needed to test and reform some caps and saw differnt results on each. After opening them up I could see both had been worked on by the inept because of the poor solder joints. I touched those up but still had problems. Luckily I found a copy of a copy of the manual. Several resistors had been replaced with ones close in value, a 100K was used where a 47K was indicated, a 1.8 megohm had a jumper across it and one 1200 ohm resistor had dropped to 33 ohms! After replacing all of the qestionable parts I could see that both units had different problems and so I started tracing the circuits. In my manual copy the bottom view of the chassis has two reisistors as R19 and I'm sure the left R19 is supposed to be R17. There's also two resistors identified as R16. I'm relatively certain that the upper R16 is correct at 25K. I'm not sure what the lower R16 is supposed to be becasue in its place I have 15K in one unit and 75K in the other, both appear to be inept replacments.
If someone with one of the TO-6s and a manual could take a look and tell me if their manual has been correct, I'd like to know what the lower R16 is supposed to be and what value.
tnx

FWIW, Henry, I prefer to use an AC output 'wall wart' and install in
the unit to be powered a pair of diodes to supply + and - which I
filter and regulate down to what is needed. For that miniscule power
demand the filter caps and TO-92 regulators will take up little room.

1125. Re: Help with HQ-160 slot filter and product detector

Newsgroup: rec.radio.amateur.boatanchors
Date: 2004-02-17 20:17:30 UTC
From: knudsenmj@aol.com.Oscar
Message-ID: <20040217151730.00545.00004404@mb-m02.aol.com>
Source record: 25586

Yet another question (sorry), about the HQ-160's slot filter circuit.
Given the schematic, should there be B+ up on the slot filter assembly on the front panel, on the cable's center conductor? I have plenty of it there.

The schematic, no matter how cross-eyed I look at it, shows that every path B+ could take to the slot assembly is blocked by a cap. But I measure nearly 200V on the cetner-tapped inductor under the chassis, the slot depth pot, and the cable feed to the assembly.

I wonder if I have a shorted cap inside T3. However, both top and bottom slugs of T3 are tunable. Maybe one of the .01 disk caps under the chassis is shorted?

FWIW, the two caps on the assembly are keeping the B+ off the coil itself. Also, shorting out the cable to ground thru a separate cap does not affect anything.

Tnx, Mike K. AA1UK

From: Angel Vilaseca <avilaseca@bluewin.ch>
Message-ID: <Xns9492DD88C6930rayomaticcom@212.35.34.213>
Source record: 25587

Hi

I was recently given a TS 820 and I noticed it behaved strangely:

-output power was only 50 W CW instead of 100.
-one of the tubes plate (the final stage of the TS820 uses two 6146B tetrodes) glowed red after a few seconds of xmitting.
- on the 40 meter band, when tuning for max RF out while watching the built-in dial, you could reach 100 W output and even beyond, then the rig fuse would blow. (I did this only once, before taking out a screwdriver and opening the rig, realizing that something was really wrong!)

I ordered a new set of 6146Bs and while waiting for them to arrive I checked all components and voltages in the final stage (not an easy task when one knows how the 820 PA is built!). All were OK.
Replacing the 6146Bs with the new ones cured the problem.

Now I should be happy, since my rig is working again right? wrong! I would like to understand what was going on when running with one of the tubes bad.

-OK, putting 50 watts out seems only logical if one of the tubes is bad, but
-why was one of the tubes plate glowing red?
-Was it the good or the bad tube? Which one of the two can I keep as a spare?
-And why dit it glow red? Could it be that the grid could not stop the electron flow and the power dissipated in the red hot plate was DC power?

Was it that RF from the good tube went into the bad, dissipating into heat?

A more general question: how do the 6146B tubes fail tipically?
Do they fail quickly or progressively?
Is it because the grid melts?
what about the screen?
what about cathode emission?
what about secondary emission? I read that this was a common problem in the 4CX250B, another tetrode.
What is the best parameter to monitor to see if the final 6146B tubes start getting tired?

Retrospectively I realize that i operated the rig for quite some time with only one of the final tubes working! *blush* Could this have caused some damage to the circuit? or spewed out a "dirty" signal?

Source record: 25593

An uncle passed away recently and left me (among other items) a Hallicrafters SX-128 receiver...unfortunately I have no use for it.

It's in very nice condition and seems to work well. I hooked up a speaker (and short wire antenna) and have been listening to various shortwave broadcasts on the different bands. It has a wonderful 'full' sound (unlike modern day radios), I can see how people could get 'hooked' on these older radios.

Can someone suggest a ballpark figure of what I should ask for it? I'm certainly no expert on older radios, but I'd say it's in xlnt condition.

Thanks for any info.

There are several things that can go bad with tubes. They can become gassy, they can have element shorts, etc. so it is hard to know exactly what happened there.

What probably happened is that one tube became weaker and/or failed. The other tube assumed the load and was stressed beyond its ratings. The total load was probably too much for the power supply and the fuse blew.

Just a guess. Without inspecting/testing the tubes it is hard to know.

73s,

Evan

Jeff
That would be very nice. I've downloaded from BAMA the TO-6 and TO-6A and the difference I see is that Sprague added two resistors R37 and R38 and changed the value of two R18, and R33. What I'm interested in is the value of R16, there's two, what are their values in your TO-6? No pix necessary unless you want to.

In addition to a good price on the Rider's, the 606A is a real nice
generator. $65 with manual in working condition is a deal.

Hi,
Well what I'm hinting at, is that I think mine didn't match the schematic either, and I recall whoever I was discussing the problem with (perhaps on the newsgroup or Forum) had a TO-6 that didn't match as well. I recall extra resistors tacked in there in parallel or something equally hokey. But that's the way it came from the factory, as it's highly unlikely that *everybody's* TO-6 has been hacked up by former owners.

Have a look on ebay to get a ballpark figure. I believe there are several
on there now. If not check the sold items.

The paralleled resistors make sense, at least to me, I have no problem understanding that part. What I think might be the case is that there are some undocumented variations between the TO-6 and TO-6A. My main problem is what is the value of the lower R16 resistor in the picture that shows the underside of the chassis.

Hey, this is going back a ways. Waaaaaaay back. but weren't these Bud or B&W coils, with "J" for junior, and "M" for ??????, and the "EL standing for end link?
Seems like the "JEL's" were store bought coils good for something like single stage final amplifiers using 6L6's or 807's feeding 72 Ohm Belden polyethelene insulated balanced line? (or, of course, link feed to a following stage with link input, either single ended or push-pull. (my biggest ever transmitter was push-pull 211's driven by an 807, using Bud (or maybe it was B&W) coils and link coupling. OH, YEAH!

>
> Will someone please explain this 48 state stuff?
>
> What's the story?

The 'story' is TIME. NO ONE in Alaska or Hawaii wants to
WAIT for 'ground' delivery, which is what is usually quoted
in the shipping price. Maine is 7 days TOPS. NOT weeks
like AK and HI are.

I asked at the Post Office, TODAY, in person, and found
that GROUND to Alaska is 4 weeks!!! So that means that
if I quote you 'parcel post' or 'Priority' - it makes NO DIFFERENCE
and will take a month to get to Alaska. Even WORSE for
Hawaii- 4 to 6 weeks.

So that means 'I'll pay the shipping at the rate quoted but if you
don't live in the lower-48, and you want it before summer, you
will have to cough up more money'

On the other hand, if I quote 'any state in the union' that means
that 48 states will get a VERY HIGH price just to make 'one price
for all' work for AK and HI.

Pretty simple. Go to www.usps.com and enter your own shipping
info and you'll see. It's really a simple issue.

Dave

That's pretty bad.. I get stuff over here (Korea, at my APO) in 7 to 10 days
via USPS Priority mail. Sometimes it even gets here faster. Just got a
radio in to repair for a friend, he sent it Parcel Post from California, and
it got here in 6 days (delivered to ME, and I'm sure it sat at least a day
on each end in transit).

I really appreciate the seller attempting to prevent me from suffering inconveniences by having to wait so long but since I live here and am accustomed to the time it takes I don't think I need that courtesy - or else I wouldn't want to buy the item in the first place.

USPS Parcel Post can 'officially' take as much as 4-6 weeks to this location. It rarely does. In maybe 50% of the cases its as fast as Priority (3-4 days) and in six years here I can think of only a few instances where it took a month. Never 6 weeks. So in a way its kinda like pot luck but if I need it guaranteed faster I can pay for Priority.

I have never asked or insisted that a seller send me something at his "48 state shipping included price", nor would I. The only time that backfired on me is once when the cost of shipping here was LESS than his "flat rate CONUS" figure.

It is indeed "pretty simple". No problem in having a flat rate for the 48 and anybody beyond pays the actual tab. Be advised that a USPS item from New York to California costs the same as one from New York to Alaska so often there is no difference anyway. What doesn't make logical sense is "buyer pays shipping, CONUS only" unless the seller has no access to a post office.

OK, thanks for the explanation Dave and thanks for the research.

Like the WMD in Iraq, which were the basis for a war and have not
been found, it seems that the postal issue has been imagineered like
Cheney, Rummy, Condi saying, "b-b-but, we thought he had WMD, he
could have made WMD, so that proves we were right."

Here's some stuff to mull over.

1) everyone in KH6 and KL7 knows how long it takes to ship items. The time is not an issue to them. If it actually takes a month, they understand. No need to protect them from the shipping delay by declining to sell to them.

2) USPS quotes the same price from FL to CA as to HI and AK. It might be counter-intuitive but there are a lot of things about shipping that are counter-intuitive. HI and AK are called Zone-8.

3) USPS priority mail to HI and AK is 2, 3 days from anywhere in the U.S. Your post office told you wrong. It's not a guarentee like Fed-EX but it's not a month either. USPS surface, the old 4th class, can take a couple days or it can take a month. There is no guarentee. Priority Mail is just as fast to HI and AK as it is to UT or IL.

4) Generally buyer pays shipping. If the price is quoted as $20 for slow-ground, and HI or AK want it sooner, they pay. They expect to pay a more to upgrade the shipping. Buyer pays shipping. Similarly, if the buyer is just down the street, they usually will drive by and pick the item up, and not pay the $20 or whatever.

5) Seems odd to say "lower 48 only" and claim that the restriction is because AK and HI buyers don't want to wait a month, which only applies to certain mail classes. Let them decide.

6) A couple years ago, I had a offer of a free (used) generator. It would have been shipped from Oregon to the East Coast. As this was a heavy item, it turned out that the shipping was more than the item was worth. In this case, as the receiver of the goods, I decided that I didn't want to pay so I passed on the item.

More on the counter-intuitive. Large, heavy, bulky items can be shipped to Hawaii and Alaska on freighters. These are the cheapest form of shipping. It is so cheap that it probably costs less to ship an item to Hawaii and Alaska than it does to ship it from, say, Chicago to Atlanta.

The cost driver on shipping isn't the distance, it's whether it goes by boat, which is cheap, or by truck, which is more expensive. Rail is in between the two. Air is more expensive.

Air Freight is expensive but it isn't as expensive as people think. Perishables, eggs, fresh chickens, lettuce, are shipped to Hawaii in refrigerated 747 and DC-10 air freighters. High value cars are shipped by air too. I know a fellow who shipped a $100,000 car by air to his buyer.

Just a suggestion. When selling, please include KL7 and KH6, just say, "buyer pays shipping or U.S. only". Please, everyone, drop the "Lower 48". That's unnecessary.

As is the tendency to not ship to military APO/FPO, which is the same as shipping to either SFO or JFK, and are technically in the mainland US....

>

Then there is shipping to Canada, which many in the U.S. refuse to do for some reason. The best way (in my experience) is to use USPS parcel post. The sender has only to fill out a little green customs declaration (just call it Amateur Radio equipment or Amateur Radio parts) and pay the postage (usually quite reasonable).

At the recieving end, Canada Post charges a flat 5 $ brokerage fee. There is no customs duty on Amateur Radio equipment so the receiver pays only applicable sales taxes plus the 5 $ brokerage. And, like your customers in Alaska and Hawaii, we understand about the time in transit.

Even size and weight are not always a problem (obviously you can't send a truck through the mail). Parcels which are oversize or overweight are charged a premium but they can still be sent by the Post Office.

Don't forget your brothers north of the 49th.

While I agree with your timing on shipments to Alaska and Hawaii - been
there done that - I disagree on your theory of one price fits all. Simply
state - BUYER PAYS ALL SHIPPING. Then charge them what it is to THEIR
location.
By saying that - I'm NOT including any costs you may charge for packing, if
any. So for example... if I have a tube tester up for bids and let's say two
people are potential winners - one in Alaska, the other in N.C. - a dead
heat in bidding. They ask me the cost to ship. They supply the zip code, I

give them the cost to their respective locations - regardless what it is. "I" do not charge to pack. So all I would bill them for is the shipping which WILL include insurance. I NEVER ship without insurance and at least Confirmation of Delivery. Now, having been given the cost to ship, it is up to that bidder to continue to bid for a win. "I" will ship to the US or Canada (if need be). I dislike the paper work of Canada, but I'll still ship there. But I'm not a great fan of shipping to the other countries. I suppose if they want to pay the price, I'll do it. But for now, I've done all of the US with no problems. In all of my shipping quotes, usually I'm on the money 98% of the time. There are those few times I've been within a $1 plus or minus on cost. If it is a $1 more, I eat it. I find the right size container, packing materials and use a good postal scale. Prepack, weigh and measure. Plug all info into the shipper's web site. I do pretty good. It doesn't have to be rocket science. I've shipped many items and I have yet to have any problems with a package getting to it's destination or any arguments in cost. I did get thrown off with the deal to Alaska though... I was told something like 8 days and as you pointed out, it was 4 weeks. A HELL of a huge difference. I believe that was before the Postal went cyber. MNS.

My guess is that one of the tubes got gassy and started
drawing a lot of plate current, hence the red-hot plate,
and possibly the reduction in output power. You didn't
mention whether you monitored the plate current while
tuning up; you only said you looked at output power.

I wouldn't keep either of the old tubes as a spare.
One is completely shot and the other is well on its
way. In this application, it is probably best to
replace both tubes even if only one goes bad.

But I'm glad you're back on the air with no more
problems.

If you have a new or used but good 7027 or two 7027A's to sell
please let me know what you have and what you are asking for them.

These are for an amplifier in which one of the two 7027A push-pull
output tubes is bad (gassy with a blue glow), and the other (good)
output tube is a 7027, not a 7027A as it's supposed to be. I am
planning to sell this amp after it is whole again, so I don't want to
put a lot of cash into it.

Thanks.

From: knudsenmj@aol.com.Oscar
Message-ID: <20040218152512.11022.00004170@mb-m14.aol.com>
Source record: 25526

Last nite I buttoned up the HQ-160 and decided to apply power to a dusty HX-50 SSB exciter. Seems OK so far. The previous owner has wired in SS diodes to replace the 5R4 or 5V4 tube, and someone left a GT-style 100 KC cal xtal in that socket -- yes, I found it before powering up.

So far I've read a little cathode current on the meter, which goes down when I adjust the rear apron bias control. And I can hear the VFO on a nearby rx -- calibration seems good. Both sets of cords are OK -- man, that bandswitch cord system is scary, more so than the Viking II's loading control.

Now that I've already done the stupid thing of powering up without reforming the caps (assuming I really do have B+ in the beast and not just bias and LV supplies?), does anyone have any hints or comments about this rig? Quality, value, things to look out for, gotchas?

Such as, which mode position is best for initial tune-up into a dummy load? CW? Nice to have a Drive control so I can start small on power levels.

Might take me a while to find a mic connector (I think every TX maker wanted to sell his own line of mikes -- no two connectors alike).

I had one many, many years ago and it was a good rig. I seemed to have
a persistent problem with popping diodes in the bias supply but that may
have been 'my' problem.
Mine had a regular Amphenol mic connector - dunno if that was original
but I didn't need PTT anyway :-)
I wound up changing to 6146 just for the heck of it...no real difference.
It tunes up easy...assuming its neutralized just tune for max output.
You really can't tune it up wrong. I recall it being persnikety about
the 6AW8 and 12BY7 (I think they were) having the tube shields firmly in
place - not unexpected.

The 6146, by the way, is a very tough cookie. I have never burned one up
yet. I've replaced some when they probably didn't really need it, though.

I still have the originals in my 1981 TS-830 that I bought new. It has
withstood RTTY etc., and still go on as well as they ever did.

I think mine has the original bias supply diode. I measured the bias voltage
and it adjusts over a wide range.

I *did* find out that the other diodes in there were just replacements for the
low-voltage B+ supply, 375V or so. Four diodes in series-parallel. No idea
what the original was, other than Moore's book entry.

Will have to go up in my attic and break into the Rectifiers box to hunt up a
5R4. No wonder the wiring was intact around the socket. I guess the cathode
current I was reading was just screen current plus grid drive.

>Mine had a regular Amphenol mic connector - dunno if that was original
>but I didn't need PTT anyway :-)

Mine is what you'd probably call a single-pin Amphenol -- a big screw ring with
a hot contact in the center. I have some signal generator probes like that.
(The real problem is with my Ranger, whose Amphenol has two hot pins inside the
screw circule, one for PTT as you said).

With all the adjustments provided, the VOX inthe HX-50 should work well. It's
nice that it has a built-in antenna relay -- would be a nice match with my
HQ-160 or 180 (though I'd rather use the 180 for AM).

BTW, who designed that function switch -- you have to go thru the MOX (on)
postion to get from STDY to TUNE (CAL). Not the first nor last poorly laid out
rotary switch, but darn, this is a Hammarlund...

>I wound up changing to 6146 just for the heck of it...no real difference.
>It tunes up easy...assuming its neutralized just tune for max output.

Glad to hear that a 6146 drops in. I was thinking the 6DQ6 in there was a
seep tube, but the power trans' AC is over 800V and sweep tubes are usually
lower, IIRC.

But the 6146 pinouts and heater voltage will match OK?

I haven't cracked the PA cage yet (did Hammarlund own their own screw factory?)
but I trust there's a neatralizing cap in there.

What's the purpose of the nice air trimmer cap in the relay compartment below
the PA?

>You really can't tune it up wrong. I recall it being persnikety about
>the 6AW8 and 12BY7 (I think they were) having the tube shields firmly in
>place - not unexpected.

Well I know I'm getting drive thru those -- turning up the Drive draws more (screen) current in the PA. The shields are pretty rusty, but I have some spares handy. Drive tuning is broadband per band, so assuming the coil slugs are set right for each band, you are right, the tune-up should be easy.

Some rigs (like Viking II or KWM-2) are really paranoid about drawing too much grid current, especially when tuning up without PA B+ applied. The HX-50 doesn't even have a grid current mode on the meter, so maybe this is less of a concern?

Tnx and will keep you informed -- Mike K. AA1UK

Hi, Mike

The 6DQ5 (not a 6DQ6) and the 6146 have different pinouts -
Bill only meant that he rewired the octal socket to take a 6146
instead of a 6DQ5.

73,
Ed

I found the VOX to be pretty decent for an old rig. Of course mine
wasn't an 'old' rig at the time :-)
>

> But the 6146 pinouts and heater voltage will match OK?

Rewire the socket. No biggie. But I'm not recommending this. The
power out of the 6146 was less...its that they were cheaper than the
6BQ6 which didn't hold up all that well. Now its a 'rare' vintage rig
and I wouldn't hose it up.

>

I don't think you CAN draw excessive grid current with it!

1178. FS: NOS Heathkit Manuals and Other Literature

Newsgroup: rec.radio.amateur.boatanchors
Date: 2004-02-19 05:40:48 UTC
From: Dave Hollander <n7rk@cox.net>
Message-ID: <40344C5D.A804E6C8@cox.net>
Source record: 25539
Cross-posted to: rec.radio.amateur.boatanchors,rec.radio.swap,alt.ham-radio.marketplace,rec.radio.amateur.equipment

I found a stack of NOS manuals that appear to have been purchased without the kit as none have the check marks for assembling the item. Finding an unmarked manual is rare unless you happen to come across an unbuilt kit. Prices do not include shipping.

I will ship overseas.

Heathkit RX-1 Mohawk Receiver Manual - NOS.....$75 plus shipping
Insides are excellent and the 10 foldout drawings are there. The back cover has a small stain in the lower left hand corner and a bit of shop ware. Date on manual is 1959.
http://members.cox.net/radiostuff9/heath_mohawk.jpg

Heathkit 2 Meter Converter XC-2 Assembly Manual.....$65 plus shipping
Insides are excellent and the 8 foldout drawings are there. The back cover has a a bit of shop ware and their is a small stain on the lower left bottom of the front cover. Date on manual is 1959.
http://members.cox.net/radiostuff9/heathxc2.jpg

Heathkit AC-1 Antenna Tuner Manual- NOS.....$50 plus shipping
Insides are excellent and the 2 foldout drawings are there. The back cover has a a bit of shop ware. Date on manual is 1957.
http://members.cox.net/radiostuff9/heath_ac1.jpg

Heathkit SB-10 Single Sideband Manual - NOS.....$75 plus shipping
Insides are excellent and the 4 foldout drawings are there. The back cover has a a bit of shop ware. Date on manual is 1958.
http://members.cox.net/radiostuff9/heath_sb10.jpg

Heathkit HW-19 Manual 10 Meter Transceiver.....$65 plus shipping
This is the ten meter version of the lunchbox (Twoer). Insides are excellent. The back cover has a a bit of shop ware. Date on manual is 1960.
http://members.cox.net/radiostuff9/heath_tenner.jpg

Heathkit CO-1 Code Practice Oscillator Manual.....$20 plus shipping
Insides are excellent and the 1 foldout drawing is there. The back cover has a a bit of shop ware. Date on manual is 1959.
http://members.cox.net/radiostuff9/heathcpo.jpg

Heathkit HD-19 Hybrid Phone Patch Manual.....$22 plus
shipping
Insides are excellent however their is a small bit of water damage in
the lower left bottom of the pages. None of the page are or were
sticking together The back cover has a a bit of shop ware. Date on
manual is 1958.
http://members.cox.net/radiostuff9/heath_patch.jpg

Heathkit AM-2 SWR Meter Manual-NOS.....$22 plus
shipping
Insides are excellent and the 1 foldout drawing is there. The back cover
has a a bit of shop ware. Date on manual is 1959.
http://members.cox.net/radiostuff9/heathswr.jpg

Heathkit B-1 Balun Coil Manual - NOS.....$22 plus
shipping
Insides are excellent. The back cover has a a bit of shop ware. Date on
manual is 1957.
http://members.cox.net/radiostuff9/heath_balun.jpg

Non-Manuals

Heathkit Catalog - Winter 1985.....$10 plus shipping
Very good condition.

1182. Wanted: National MCN or SCN dial parts

Newsgroup: rec.radio.amateur.boatanchors
Date: 2004-02-19 13:26:15 UTC
From: k5dh@raytheon.com
Message-ID: <XP2Zb.1$tX4.0@dfw-service2.ext.ray.com>
Source record: 25543
Cross-posted to: rec.radio.amateur.boatanchors,rec.radio.amateur.equipment,rec.radio.swap

I'm looking for the black metal bezel, an unused paper
dial scale, and a usable pointer for a National SCN or
MCN dial assembly. I have the vernier mechanism and
knob. If the bezel needs repainted, that's fine. If
the paper scale has been written on, I can probably
live with that also (I'll scan it and clean it up on
the computer, then print a new one). If the pointer
is yellowed, that's okay, as long as it's straight
and not cracked.

I see NOS dial assemblies for sale on eBay all the
time, but I won't pay THAT much for one! Sheesh...

I'm building an 80m/40m VFO and I need a freq. dial!

writes:

> had one many, many years ago and it was a good rig. I seemed to have
>a persistent problem with popping diodes in the bias supply but that may
>have been 'my' problem.

I think mine has the original bias supply diode. I measured the bias voltage
and it adjusts over a wide range.

I *did* find out that the other diodes in there were just replacements for the
low-voltage B+ supply, 375V or so. Four diodes in series-parallel. No idea
what the original was, other than Moore's book entry.

Will have to go up in my attic and break into the Rectifiers box to hunt up a
5R4. No wonder the wiring was intact around the socket. I guess the cathode
current I was reading was just screen current plus grid drive.

>Mine had a regular Amphenol mic connector - dunno if that was original
>but I didn't need PTT anyway :-)

Mine is what you'd probably call a single-pin Amphenol -- a big screw ring with
a hot contact in the center. I have some signal generator probes like that.
(The real problem is with my Ranger, whose Amphenol has two hot pins inside the
screw circule, one for PTT as you said).

With all the adjustments provided, the VOX inthe HX-50 should work well. It's
nice that it has a built-in antenna relay -- would be a nice match with my
HQ-160 or 180 (though I'd rather use the 180 for AM).

BTW, who designed that function switch -- you have to go thru the MOX (on)
postion to get from STDY to TUNE (CAL). Not the first nor last poorly laid out
rotary switch, but darn, this is a Hammarlund...

>I wound up changing to 6146 just for the heck of it...no real difference.
>It tunes up easy...assuming its neutralized just tune for max output.

Glad to hear that a 6146 drops in. I was thinking the 6DQ6 in there was a
seep tube, but the power trans' AC is over 800V and sweep tubes are usually
lower, IIRC.

But the 6146 pinouts and heater voltage will match OK?

I haven't cracked the PA cage yet (did Hammarlund own their own screw factory?)
but I trust there's a neatralizing cap in there.

What's the purpose of the nice air trimmer cap in the relay compartment below
the PA?

>You really can't tune it up wrong. I recall it being persnikety about
>the 6AW8 and 12BY7 (I think they were) having the tube shields firmly in
>place - not unexpected.

Well I know I'm getting drive thru those -- turning up the Drive draws more (screen) current in the PA. The shields are pretty rusty, but I have some spares handy. Drive tuning is broadband per band, so assuming the coil slugs are set right for each band, you are right, the tune-up should be easy.

Some rigs (like Viking II or KWM-2) are really paranoid about drawing too much grid current, especially when tuning up without PA B+ applied. The HX-50 doesn't even have a grid current mode on the meter, so maybe this is less of a concern?

Tnx and will keep you informed -- Mike K. AA1UK

I have a pair of 7027 pulls that I will sell you for a whole lot of money.

If you don't want to spend a lot of money, put the brand new Sovtek
5581WXGT tubes in there. They have as good dissipation as the 7027,
the bias point is similar, and they sound better to me. The only real
problem with them is that the 7027 has the control grid brought out to
two pins while the 5881WXGT has it only brought out to one pin. So on
some amps you may need to add a jumper.

If it absolutely has to be original and you're selling it to a collector,
send me a lot of money and I'll send you a 7027 pair. But if you want it
to actually sound good and be reliable, get a quad of the cheap 5881WXGT
tubes from Antique Electronics Supply and sell the good 7027 pulls on Ebay
to guitarists.

I've decided to sell my best VHF AM/SSB station. Consists of the Clegg Interceptor receiver and the Clegg Zeus transmitter with matching power supply/modulator. In near mint collector condition with copies of the original manuals. Perfect higher power AM and SSB station. Both units have the big, smooth turning Jackson Bros. dials. Due to the weight of the PS, I would prefer pick up in Greer, SC. Price $750.

Hi Jim

Sure, plate current went far above the normal 500 mA, particularly on 7
MHz, where the rig blew its fuse.

One point you mentioned is very interesting. You wrote that when a tube gets gassy, plate current goes up to the point the plate can turn red hot. I'm no specialist and i would have thought that the gas molecules in the tube would be an obstacle for the electrons so plate current would decrease.

I've got an older (1970's) GE mobile radio that I'm trying to get some information on. Unit has trunk mounted radio with control head, microphone and speaker inside vehicle. Model number appears to be: RG56TAS66. Radio is single channel; control head has volume plus monitor button (internal squelch). Any help is appreciated.

Well, I found a nice mil/industrial 5R4WGB tube (with special plastic base that covers up part of the tube), and also DLed the HX-50 manual from BAMA.

Very helpful to know the bias setting (50-60 mA) and how much cathode current you dare load up (wow, 180 mA, that's a lot, given that a 6146 tops out at 150 -- however, the plate voltage allegedly drops to 600V).

Also that the little knob under hte PA on the relay compartment really is the neutralizing cap. Beats reaching between the "hot" finals with a screwdriver, like in those high-priced Iowa rigs.

Everything seems to work, except no modulation on SSB or AM -- that is, no increase in RF out or DC in when I zap the mic center pin with a screwdriver, with the AF gain turned full up. Hope that compactron isn't dead in one section. Audio circuit should be easy to troubleshoot, especially since that portion of the BAMA schematic is actually readable (there is a section with the ghost of a tube just floating in space, with traces of wires and components around it). If I need a better schematic copy, I'll ask.

FWIW, the audio section didn't seem particularly hot in my recollection.
I ran a "piremac" (CB jargon-haha) amplified D-104 with good results
and about 9-10 o'clock in the gain. With any un-amplified mike needed
it to go waay up in my case.

Every radio is basically performance vs. cost, collector's items
excepted. In the category of under $100 radios it is typical.
Selectivity, stability and immunity to overload tend to be more
expensive but for BCLing and SWLing I think its an okay radio.

Have you tried on line to look up "surplus" outlets? Fair Radio Sales - sometimes has TTY units up for sale.
I can't recall some of the other places off hand, but there are some magazines like Popular Communications - I believe (if memory serves me correct) that have ads for dealers of just such sorts of surplus. Somewhere around here which I have yet to find, is a magazine with a whole page of addresses of dealers of that sort of thing. I'm packing to move, so I have no clue what box it may be in. But there were many addresses. IF all of them carried a unit, your options for price and so on would be good. But try looking up TTY, Military Surplus, etc online. I'm not sure if you have.. but just suggesting. Try perhaps all variations. Even a model number, now that you've been given the correct one. You may be pleasantly surprised. Often if I can't find it with one listing, I try another and another and soon I find a "hit". If I can find that magazine in short order, I'll reply back. Not sure how soon you need it, but I've seen TTYs at hamfests for give away or very dirt cheap. Try one of them. Not sure if they were of the model you seek. MNS

6EW6 is not essential. Any remote, semiremote, or sharp
cutoff pentode with a base 7CM will work.

I've used 6BZ6, 6CB6A, 6BH6, etc with no big rx difference.
6EW6 has very high gain (high gm).

watch out for the diode multiplier chain. sometimes, they go
south.

also, check the 6GE5 bias electrolytic. it can dry out, like
the other electrolytics.

replace all the large wattage carbon comp resistors. they
change value dramatically!

can send you copies of enhancements published in CQ mag,
from years back.

good luck.

Yes he's being funny. If it was a FRG-7 it wouldn't be so funny.

I believe it's a DX-200 I had once -- two drum dials, over and under. A very sensitive and "hot" receiver, with its FET front end. Good SSB selectivity and performance. AM selectivity is also tight -- maybe too tight, see below. ISTR the BS dial carried both the Ham and SW BC calibrations.

I stopped using it and sold it because the audio BW was too wide for the rather narrow AM IF BW. That is, the audio had lots more treble than the radio itself could deliver from the signal, and the result was harsh to listen too. You could probably hotwire a cap or two across the audio lines inside to cut the freq response.

All in all, a nice little radio, given the usual image problems on the higher bands with single conversion. Be prepared to spray lots of DeoxIt into the linear bandswitches (same as with Panasonic units). BTW, Kenwood made a couple sets that looked a lot like this one -- maybe they made it for Tandy.

Behold, Judah Smith signalled from keyed 4-1000A filament:

> Are you making fun of me? :)

Nope!

I have owned every Rat-Shack RX up to the DX-440 and having worked for them, used every Grundig up to the Satellir 800 - all junk compared to the DX-200, IMO.

The front-end overloads easily, so if you're getting lots of images/splatter, turn the RF gain to somewhere between 9 and 10 o'clock and you'll be OK :-)

Hi , I have an old Sonar FS23 tube CB radio which has a Plate Adjustment knob on the back of the radio. How and why is this used ?. Does anyone know the procedures on how to make the Adjustments on this.
also
there is an Antenna Adjustment Screw on the back of this radio as well. Does anyone know the procedures on how to make the adjustments to this also.
Please let me know. Thanks to all who can help me.

To adjust the output circuit,
attach the rig to a well balanced antenna.
Start with the "Antenna" capacitor fully meshed.
Transmit with no audio, adjust the "Plate" capacitor
for maximum forward power on your rf wattmeter
or SWR bridge. Decrease the "Antenna" capacitor slightly,
and repeak power output with the "Plate" capacitor.
Repeat until there is very little further increase
in output, should be around 3 or 4 watts output.
Do not reduce the "Antenna" capacitor beyond that point.
Note that the peaking of the rf output with the "Plate"
capacitor should always be the last operation performed.

Ed Knobloch

Message-ID: <2004221-213916-800850@foorum.com>
Source record: 25491

QRZ.com was one of the first. QTH.com is one of the neebies. They
are opening up a bees nest of BS with their forums. Eham will publish
everything from racial slurs to hams demanding ham businesses be JAILED
if their parts are a week or two late. If you have something positive to offer,
you're generally censored. (I guess the theory is that flames bring "visitors"
to the site.)

I gave up on QRZ.com YEARS ago when they started the forum crap. The mud
slinging got so bad, it became worse than Usenet! (Hard to believe, huh?!)

The latest entry is QTH.com. Scott seems to be keeping it under control. But
how long before someone posts the wrong thing and QTH.com gets involved in a
libel case???

I know some of you are going to choke, but I think one of the best, most well
maintained, most positive, and most responses from classifieds is ARRL.org. Now
if they'd just get a DX Cluster server at the site, I'd be their all day!

73 from Mike

From: Reg Edwards <g4fgq.regp@ZZZbtinternet.com>
Message-ID: <c18iqp$hk7$1@hercules.btinternet.com>
Source record: 25488

For given ground path distance and height of reflecting layer this program
calculates elevation angle, angle of incidence with the layer and the
radio-path distances for one and two hops.

The program then gives an insight into how the various losses are
proportioned along the radio path. A 100-watt transmitter is used at one
end of the path with a receiver + S-meter at the other.

Download in a few seconds program TWOHOPS from website below and run
immdediately.

But he was known for taking things out, while the scheme in the original
(it's been so long) seems way overly complicated. After all, the Q5er
was adding selectivity to a lousy receiver, while this uses a whole
shortwave receiver when only a BFO is needed, and that receiver doesn't
have better selectivity than the main receiver.

It seems more like a Rube Goldberg scheme.

I don't get it. Forums, Usenet and the type of mudslinging that goes on
is a bad thing but locating DX via an internet 'DX cluster' instead of
skillfully tuning around is a good thing.
Dude, you have to accept the whole package these days or else just shut
off the computer and stick with old-timey hamming.

Amen. I did just that a few years ago, as I was tuning a weak F7 station,
and finally got his callsign - then jumped on the web and looked up his
call,
and before he turned it back to me I was looking at his house, his shack,
his kids, and knew more about him than my next door neighbor.

That ain't hamming. So now I have NO computers in the radio room.

JOE

Occasionally they fail with screen-plate shorts. If they have not been
damaged by excessive screen currents, you can sometimes bang them hard
against the desk a few time and dislodge the little balls of metal that
cause the shorts.

I'm not sure in this context if I should agree or disagree with you,
Joe. Just what you say is a great and cool aspect of the internet in
respect to hamming.
In contrast I note that you said you actually tuned into and found Mr.
F7 and weren't depending on internet props to tell you if you had the
best rig or if an F7 was on the air and this might be the (one of the)
aspects that the original poster was having trouble with.
Hell, I can call the guy on a cellphone for pennies and get pix of his
kids and not "suffer a code test" but doing it simply with MY generated
ether has an attraction that nowadays is the last remnant of the hobby.
This is 'instinct' for hams...wheat vs chaff hasn't changed in spite of
new technology..

1237. Help ID RCA tube radio Superhet. Model #: 5 QR 64 X

Newsgroup: rec.radio.amateur.boatanchors
Date: 2004-02-22 01:52:06 UTC
From: "John T. McDougald" <johnmcd348@verizon.net>
Message-ID: <aXTZb.43452$5W3.8426@nwrddc02.gnilink.net>
Source record: 25397

I need the help of those out there who know about the old tube model RCA radios. I just picked this up at a little antique shop and I can't find any info on it from the Net so far. Here's the info I have gotten from it so far:

Model # 5 QR 64X

Covers: 150-380 Kc (KHz)
520-1605 Kc(KHz)
2200-7000Kc (KHz)
7000-22000Kc (KHz)

Voltage Rating: 110Volt
127Volts
150Volts
180Volts
220Volts
Made in West Germany for Radio Fernseh Elektro G.m.b.H. An associated company of Radio Corporation of America.

Can someone give me some info on this radio? The case is in pretty good shape, the sound was great and the reception was pretty good too on AM and SW frequencies. I just need to clean out all the dust before I play it for any length of time. Also, the dial hangs when trying to change channels. Any tips for that would be appreciated.

Thanks
John T McD.

That seems to be a common RCA German-made radio. Is there anything
specific that you need to know? The actual schematics seem to be scarce
but the basic scheme on most of them is kinda ordinary.
Not bad sets. try rec.antiques.radio+phono and maybe someone can zero
in closer on that particular model.
Replace all paper caps and selenium rectifier is the norm for future
trouble free opertion. Many of this era used some polystyrene caps and
they have held up well over the decades.

Thanks Bill for the quick response. Actually, the Schemes were one of the things I was interested in. It looks like there used to be a set posted inside the radio but were removed. I'm interested in the general value, dae of manufacture (40's-50's, etc) and such and any other type of info I can get on this radio. I don't know alot about antique radios But I definitely liked what I heard for the few minutes that I had it plugged in.

Thanks
JTMcD.

I got the audio and modulation working, and verified the rig works on SSB and AM. The problem was a forehead-slapper: when I wnet to feed an audio generator into the mic lead, I found a dead short to ground. Thinking the shielded cable from the Amphenol connector to the audio tube had shorted out (often happens when soldering melts the inner insulation), I lifted the cable's ground at the tube end. Still shorted.

Then I got suspcious and checked out the mic connector more closely. Turns out some genius at Amphenol had designed it so that when no mic is screwed onto it, it shorts to ground! The center contact is on a metal plate that actually moves in bit to flift the ground when you screw onthe mic cable.

So now I know I have a working HX-50. I'm tepmpted to (temporarily) rewire a standard 3-terminal phone jack back there, to use my D-104 mic with PTT, and wire the PTT screw terminal over to the jack. Then I could test the rig on the air, maybe with the HQ-160 (don't want to risk the HQ-180 on the antenna relay built into the HX-50 just yet).

Of course before selling the rig I'd put the Amphenol jack back in, right? Or include it in the package and let the buyer decide?

Greetings- I have one in a high level transmitting mixer I built in about 1960. The mixer took about ten watts in on 14 mhz from my HT-32B, mixed it with the output of a crystal oscillator, drove the grids of the 829B ,and the output was 144 mhz ssb, enough to drive a 4X-150A amp. The circuit was designed by Don Stoner, W6TNS, and published in CQ mag., as I recall. The tube was used in VHF military gear . It has a little brother, the 832A.

In the 'spirit' of 'before selling' after a few days of having it why
not use the rig for a while to get a feel for it. Its not a bad rig and
you might enjoy the fun.

FS Nice Drake TR5 Transceiver and matching Drake PS-75 Power Supply.
This is very clean gear cosmetically. It looks almost new. It does works,
but needs an alignment. Receiver sensitivity is low. Calibration is good
and the digital readout is bright and clear. Everything works. I have made
several contacts and get good audio reports. It puts out around 90 watts, a
little more or a little less depending on band. The rig includes the
original manual and all cables. Price is $750 plus shipping. Digital
pictures available. Thanks, Charlie Hugg, K5MBX

While this is obviously a power transformer, I am begining to think it was used as a modulation transformer. The rest of the chassis contain parts for a 2500 volt power supply. Then there is this lone transformer with few supporting 7pieces , no rectfiers, no caps of any substanial size. There is achoke and a couple of very small caps .5uF , looks more like an audio filter than something for a power supply. A lot of the under chassis wiring had been ripped out so it is hard to tell.

A nice example of a vintage unbuilt Heathkit in excellent condition.
Remote control for Heatkit GRA-2001 Televison Set. This kit contains
both the hand-held transmitter control and the receiver portion that
is wired into the the television.

The kit displays nicely and appears to be complete with all
documentation. There is some writing on one side of the box.

Manufactured by The Heath Company, Benton Harbor, Michigan.

have no experience related to 6146's for the 40 years I've been using
them at home and coast radio- as well as TV-transmitters, the only
experience is related to bad design on amplifiers. Particularly bad
control grid or screen supply circuits.
Some cures was described in Radcom Technical Topics by Barry Priestley
G3JGO around 1972 and I have mentioned one on my page for FT901/902
mods http://home.online.no/~la8ak/b21.htm while I believe his
experience was with some Heathkit transceiver, my mods applies for
most similar stages, not necessarily 6146B

well, you have a difficult problem to solve, probably impossible to solve. Either by using AGC derived or other IF derived type squelch is not possible for reasonable threshold level. FT-101/101B/221/225 series have some design faults and cannot easily be cured. I spent some weeks trying to sort out what was the problem with carrier leak in FT-101B, and another weak to discover that FT-221 had the same problem. The carrier leak is so strong that ssb signal is perfectly well demodulated when the wires between the carrier oscillator and product detector are removed. The signal seem to follow through the 10.7MHz If stages, probably also the converter.
I have mentioned something about it on the page for FT-221

>Everything seems to work, except no modulation on SSB or AM -- that is, no
>increase in RF out or DC in when I zap the mic center pin with a screwdriver,
>with the AF gain turned full up

I got the audio and modulation working, and verified the rig works on SSB and AM. The problem was a forehead-slapper: when I wnet to feed an audio generator into the mic lead, I found a dead short to ground. Thinking the shielded cable from the Amphenol connector to the audio tube had shorted out (often happens when soldering melts the inner insulation), I lifted the cable's ground at the tube end. Still shorted.

Then I got suspcious and checked out the mic connector more closely. Turns out some genius at Amphenol had designed it so that when no mic is screwed onto it, it shorts to ground! The center contact is on a metal plate that actually moves in bit to flift the ground when you screw onthe mic cable.

So now I know I have a working HX-50. I'm tepmpted to (temporarily) rewire a standard 3-terminal phone jack back there, to use my D-104 mic with PTT, and wire the PTT screw terminal over to the jack. Then I could test the rig on the air, maybe with the HQ-160 (don't want to risk the HQ-180 on the antenna relay built into the HX-50 just yet).

Of course before selling the rig I'd put the Amphenol jack back in, right? Or include it in the package and let the buyer decide?

The issue was never "did he ever have WMD". He did. This was not
in dispute. Nor was the issue, would that scum have used them,
certainly he would have.

The issue was "does he, as of late 2002, early 2003, have WMD." We
thought he did. He said he didn't. It turned out that he didn't.
We were wrong.

The fact that Cheney, Rummy, Condi are in denial is sad. They are
bright people and want to do their best. Unfortunately, they made a
mistake, can't admit it, and have been spinning reality. The term
for this is imagineering. It is a mental illness of the powerful
and pompous. "I am the big dog, therefore I do not make mistakes."

The last bit that they spewed out was something about, "well, he
could have made WMD." That's beyond sad. If you had wings, you
could fly.

It's sad. It's sad that 540 moms, dads, wives, children, have lost
the world.

The fact that Sadam is a worthless piece of protoplasm does not make
it OK. It's an ethical mess.

Tobacco smoke?

Ammonia helps a lot, but honestly the best thing is just to let it air
out in a well-ventillated place for a couple months.

I have gotten a real nasty ones, the only thing that work's best way is to carefully scrub with elecroststic smoke eater cleaner + final rinse with distilled water and a good long hot air dry. Its not cheap, about $14 at Sears.

I hear of some guys on the Heath reflector covering the cans, vfo's, etc and using the dishwasher.
I have never done this, perhaps it was a joke.
However I do bake enamel on R-390 knobs in the toaster on 175 for a couple hours

I have an old Dynascan PR-43 VTVM Probe that I will ship to you for $2.00. That should just about cover postage and a padded envelope. It is black in color, and has a "DC / AC Ohms" switch on it. It has an old microphone connector on the end of the shielded cable, just like those used on Heathkits. I have not tested it so it is "AS-IS." I just want to get it to someone that might have a use for it.

Please contact me directly at jvercellino@yahoo.com.

Hi Scott,

I have gotten radios that were used by hams that had chassis that
were stained yellow brown from the tar and nicotine. There is no
amount of airing out that will make that go away. With them, the
only answer is scrub, scrub, scrub. The cleaning solution comes out
as brown as grasshopper spit.

If the radio is built with modern components, isopropyl alcohol can
be applied with a small paint brush and scrubbed around with no harm.
Waxed paper capacitors will not tolerate that kind of treatment, though.

Isopropyl will kill acrylic's, so don't let it touch dials, and windows.
It soaks in, and then forms quickly running cracks...zip!

Spray cleaners like 409, work too, spray liberally, and
scrub with a brush, and rinse with pure water, distilled is best.
Drying in a convection oven (fan circulation) at 140F finishes up the
job. A cardboard box with a fan, and a light for a heater works too.

I have a Tek 585A that is pretty clean inside, but has that o'de
trailer park smell... You know, tobacco, dog and Glade air freshener.
I thought it would "air out", but a year later, it still reeks. I am
going to have to give it a bath one of these days.

Hi Joe,

It's not a joke! I have done this, and it works very well.
It is a bit aggressive on paint, though. It was a standard
treatment for old tube trunk mount 2-way radios.

Hams, being smokers of professional caliber, really wreck their
equipment with tobacco smoke. Sometimes a dishwasher is the best
way. When the chassis comes out of the DW, it is as pretty as when
it was new. Water isn't harmful to most electronic parts. You have
to bake the radio for 24 hours after doing this kind of treatment.

No.

You're trying to sell something that has nothing to do with radio,
in two newsgroups that most definitely are not general buy and sell newsgroups
(and even if ads are suitable here, they would pertain to the topics at
hand).

Find a buy and sell newsgroup for your junk.

The fact that you have wrapped your ad in a "for trade for shortwave"
wrapper is irrelevant. You are not selling a radio.

But that's why they become rare.

Remember when the telephone company had programs in place to get teletype machines into the hands of amateurs, rather than scrap them? In the early seventies, I remember hearing that ASCII machines were available here in Canada. But at that time ASCII wasn't allowed on the ham bands (and of course few had the equipment), and home computers hadn't hit yet. So I gather the machines went begging. Then home computers came along, a and they became more valuable, until enough equipment came along so people would rather have video displays and small dot-matrix printers instead of big and noisy teletype machines. That started the decline. Fewer people wanted them, and few wanted to take them, and they took up so much room. That would cause them to be tossed out.

So if there is demand, there is a smaller supply, and the price goes up. But if still few want them, and realistically nobody needs a mechanical teletype machine for practical reasons, then the cost remains low. But since the cost is low, it's still easy to dump them.

That's a different problem altogether. In that case, 409 is VERY effective
at removing the gum, as long as you keep it off of phenolic parts. It will
etch bakelite very quickly.

Hi Scott,

I thought we were discussing removing smoke smell? As long as the
brown tobacco stains remain on the radio, it is going to smell like
a chimney everytime it gets warm.

I forgot to mention the 409 vs bakelite problem. Most cleaners will
wash out the surface color from bakelite.

I've always found 409 to be pretty benign on Bakelite but Fantastic will indeed go after it. When you think you're washing away years of dirt and smoke its often the Bakelite itself that is washing away so do be careful with either product!

-Bill

1286. Collins 30L1 Round

Newsgroup: rec.radio.amateur.boatanchors

YES You should be able to use it with no problems -

My RCA RC-21 Manual lists both. B series is a bit better tube but you probably won't notice any difference (power output wise) until you get to 15 or 10 meters. Even then it's probably marginal.

It has slightly higher operating values compared to the "A" so I guess you can call the "B" version a ruggedized 6DQ6A.

Would pay some attention to Neutralization as "B" model would have a greater tendency to oscillate due to higher transconductance.

Happy to scan the tube manual for you if you need it.

Mike, have you confused the RCA mentioned above, with the Stromberg Carlson AWP-8? That's the only TO knockoff of which I'm aware that had weather instruments installed. There's one on ebay (Item number: 2225853356) which just sold for $56.11. (plus $35 shipping). I'd love to have one of these myself; and this one was not a bad deal, but finances right now.... :-(

Cut him some slack. The part about the friend's wife was funny, especially since I first read it as "$8 disposal's-able underPANTS"

But then, I just had a root canal and between the anesthesia, the jolt of pain, I'm not reading too clearly.

Anyway, if he wants tubes or a boatanchor radio in trade, then this is the right place.

R388s, which do not have the mechanical filters
like the 51J4s, often go for high prices if they are
in excellent to "new" condition (the latter being quite
rare).

But as far as performance goes, 51J4s with the
filters are just great and provide greater flexibliity.

Oh geez, another brain fart! Yes, you're right, I was thinking of my AMP
instead of the RCA. I have both. The RCA is perhaps the best sounding, but
the knobs are rather flimsy, though metal.

The Stromberg is built like a pickup truck (wait till you pick one up), and $56
was a steal, especially if it had the weather instruments still in it.

Then there's the Philco version, built like a tank, more rugged metal than the
tube TOs. It will anchor at least a small ski boat :-) Best sound of the
bunch.

Half of these sets (various makes) use bandswitch, half use a TV-like turret.
All fun to play with. --Mike K.

careful with 409, I've seen it degrade the panel lettering.

I de-smoked an SB-303 by hand wiping every exposed wire, part,
surface using a clean cloth damped with a very dilute detergent
solution. It took a lot of work but I was recovering from hand
surgery and needed a punishing amount of effort as physical therapy.

Gently and firmly rubbing small components for hours is excrutiating
pain but it really strengthens your fingers.

Hi,

I can't say that I have ever seen 409 damage anything, but I tend
to work on commercial gear. Ham gear often uses sub commercial
practices in its construction. I remember trying to deflux the boards
in a SB104 that I had just built. I tried isopropyl alcohol, like I
routinely did with commercial pc boards, and it started to remove the
solder mask! I have never seen anything like that before or since.

I can bet that hand scrubbing all those parts would do a great job of
punishing your poor fingers. Your PT would be proud!

Fahnestock clips work fine, and they're easy enough to find (e.g.
Mouser), and they even add a bit of heat-sinking. BTW, to connect
both plates in parallel, put a clip on each plate, line them up
together and run a connecting wire through the screw holes, then
solder the whole thing (quickly) and you'll have a perfectly-fitting
dual plate cap.

Yep, when playing with my R388 I often wish for the better selectivity control
of the J4. Xtal filters just don't hack AM or SSB all that well.

Though I don't suppose even the J4 has a product detector, right?

No, it did not have a product detector. I did do one author's mod to these
receivers over the years, where you convert the cathode follower for the
I.F. output to a product detector. It was great, because the mode switch on
the front panel has an extra set of contacts that you can use for routing
the audio.

I remember an old TR7A that I picked up from a friend. He threw the dead roaches and their droppings in for free.
First of all, I gave each of the boards a bath in soapy water. After rinsing them in clean water, I gave them another soaking in Isopropyl alcohol. It took 13 gallons of alcohol to clean that radio. There were even roach husks enmeshed in the PTO gears. I had to complete dismantle that PTO.
After all of that effort, there were still some stains from all of the droppings that had embedded themselves in the wiring insulation. Too bad they didn't use teflon insulated wire. When I explained the history of the radio to the buyer, he couldn't believe that it was ever in that condition.
Good thing that it is just smoke and nicotine, in your case!

Pete

CARS/N7PIR Will offer an operational check of Ham, and other Radio
Transmitters at the Puyallup WA Ham Fest on Saturday March 6th.

It's a perfect opportunity to check out that bargain radio before you
purchase at the Ham Fest, some other location, or your current radio.

Transmitter and Receiver will be tested as listed below.

PL Tone Deviation
DTMF Deviation
Transmitter Audio Frequency Response
Transmitter Output Frequency Deviation
Transmitter Power Output Level(s)
Receiver Input Sensitivity
Receiver Frequencies will be checked
A Printout of measured values will be provided.

Look for our tables on the first floor.

Thank you.

Did you know:

It's possible to replace the 26x6 tubes in the R-392 DIRECTLY with 40763 MOSFETs?

I tried it as a joke of sorts, but the radio seems to work just fine, and the current draw drops to almost nothing.

You can also plug in most any NPN transistors in place of the 12AU7 multivibrator.

Of course you don't get that nice hot-tube smell, but you can't have everything...

1311. diagnosing NC183

Source record: 25372

I've been renovating a Malden Mass Monster...NC183D. It sortta
works, but the B- is supposed to be -21 volts and 500 ohms from chassis
ground acting as the bias for the audio power amps and the negative end
of the RF gain pot.
On my rig the line measures only millivolts negative and 0.4 ohms
to ground. I thought first I had a shorted electrolytic and replaced
all the caps on the line. No joy. Then I thought the transformer
center tap might be shorted to the case, so I unsoldered it and measured
it. The Xformer is very healthy but the line still measures 0.4 ohms to
ground.
Any suggestions what I should look at next?

Use sudsy ammonia solution from the supermarket. Doesn't appear to harm anything and smoke stains just run away as does the odor. Rinse with water when done!

This happens all the time when somebody replaces the filter caps with the typical modern ones that have the case connected to the negative lead. The original capacitor probably had two leads, neither one grounded to the case.

You may need to insulate the capacitor case from chassis ground.

Did you check the link? All the instruments, but a few problems otherwise.... The $35 shipping turned me off a bit, but might be worth it if he's far enough away and takes care with packaging (Although as you said--'built like a truck;' which means they ship well--my TO knockoffs all arrived intact with minimal care in shipping.)

Do you have a link to the Philco model? I'm not familiar with that one, although I've researched a bit. I'm aware of the S-C, RCA's (have both 3BX671 and 7BX10, but not the 'alligator' 3BX--one just sold for $595 on ebay!), Hallicrafters (have the TW-1000), and the Silvertones; but no Philcos.

> Half of these sets (various makes) use bandswitch, half use a TV-like

I'm still waiting to get into my Hallicrafters TW-1000. I've got the manual...waiting for caps. It's got the turret. Looks like fun.

No, didn't chase the link to eBay. My Stromberg also survived a cross-country
UPS trip. ISTR it has flywheel tuning, just to add to the wieght :-)

No link that I know of re the Philco. It's sorry state, but no way would you
know to see it or heft it. Flywheel tuning for sure. I think the book on
Zenith TOs show the Philco in its knockoff chapter. AFAIK Philco never made a
tube TO clone. FWIW, most of the knockoffs are superior to the Zeniths in many
ways. Except the Sears Silvertone, which makes a good 1L6 donor :-) I have
most of the Zenith models.

So the 7BX10 is the other RCA TO? How is it different from the 3BX?

>I'm still waiting to get into my Hallicrafters TW-1000. I've got the

I've got two of those, slightly different, and one sort of works, but I'll
probably have to go to Heaven to find a TW-1000 whose band-indicating drum
still works. Tho I may end up in the place where every dial cord breaks and
the 1L6 always pops when you turn on the juice :-) --Mike K.

Would that mod also apply to the J3/R388? The need for extra audio switching is a big problem in most PD mods, leading to use of relays in R390A for example, with all kinds of problems. Don't recall seeing extra switch contacts on my 388, maybe just on the J4.

Since the BFO switch is broken on my SP-600, I just might replace it with a 3PST switch (good luck) and put a PD tube in place of the BFO driveer. --Mike K.

Wasn't an old trick to put a relay in the line to the BFO? So when
you turn on the BFO with the existing switch, the current through
the relay causes it to switch, and then the relay contacts can
route the audio properly.

Michael

This filter cap is an actual new old stock in the old style case
which sits in an octal socket isolated from ground. I can try pulling
the cap and see if the B- line goes up to 500 ohms above ground.

Yes, that's how the previous owner of my R390A tried to do it, and I bought another relay to try to improve on the job, since his was sticking ON. The two problems are: finding a relay sensitive enough to trigger on the BFO plate current, and with enough contacts to do the switching, and cramming the relay into the underside of the BFO sub chassis (no mouse droppings in there -- mice can't fit inside!). Without messing up the AVC voltage into the ANL.

The R390A job is complicated by the natural desire not to run any extra wires to the IF module and spoil the neat connectorization. 73, Mike K.

I'm really surprised that no one has observed that smoke is actually the reason radios work at all. I recall being taught that once the smoke is released, the radio usually stops working. I'm pretty sure the smoke is contained inside those little glass bottles...

This is all of course moot, if the smoke is known to have come from another source.

BTW, Fantastik, Spray-nine, 409, and many others are mostly NAOH solutions and are eschewed by the conservators. Murphy's is, I think, saponified vegetable oil, and considered pretty safe.

My teacher (the guy who figured out the importance of smoke) also said Hiram Percy Maxim was Edgar Cayce's evil twin.

Hi all, I've just aquired a 1936 vintage HRO receiver and want to restore the cabinet. I can't seem to get the main tuning knob off. I've removed the set screw, and when the variable cap hits the stop, the knob will continue to turn, but not come off It feels like something is still "connected" for lack of a better term. Since the knob has the vernier mechanism I'm reluctant to put too much pressure on it. IS there something I'm missing here. Thanks in advance for any help.

I use Simple Green - 100% strength. Spray, let sit, and rinse with water. It's supposed to be non-toxic and biodegradeable, too.

I air dry when it's nice and warm outside, or I put it on the sneaker rack in the dryer, with the heat down way low, for about a half hour/45 minutes/ or so.

I've found the dishwasher can be a bit too vigorous. Also, there's something personally repugnant about cleaning crap-infested radios in the same thing you use to wash your dishes and utensuils... (Or is that vice versa :)

Bob,
The knob should have two set screws (I believe at 90 or 180 deg. from each other). Have you loosened them both sufficiently. Perhaps one is hanging up on a scored portion of the shaft? At any rate, directions for removing and re-installing the main tuning knob are found at Radio Bay (a National Radio web page) www.io.com/~nielw/ .
My personal experience in removing many of them is that - it should come off relatively easy. If you follow directions carefully, it goes back on just as quick.
Best of luck,

Roger Brown, KL7Q ZUT982

William,

I'd check C-65, pin 8 on AC Jumper/Battery Soc. (X-1), R-36 and R-37, everything at S-1A, and in general, all components associated with the AVC Amp (V-16), the Phase Inverter (V-12) and the Audio Output section (V-13,14) and anything else which might in any way connect to these sections. Perhaps this is elementary and you have already run down these trails. R-36 and 37 would be my first looking place. Any of these could easily pull your line down (actually, I guess that would be up).
Good luck,

Roger Brown, KL7Q

Those knobs are unique. One has a calibrated skirt. I had three SX-28s once. One had two good knobs. Another had the original knobs, but the markings were worn off the skirt by a misadjusted pointer. The thrid set had a badly repainted panel and non-original knobs (no calibrations).

A good set of knobs is like a good ivory tusk. For every good knob/tusk, there's a dead SX-28/elephant rotting away somewhere.

And next time your wife brings home the week's groceries, ask (in some polite, subtle, way) if she got out for less than $72.50 :-) --Mike K.

No, glass bottles are unique in that they don't run on smoke, unlike their
sorry-state and disintegrated-circuit replacements, which are notorious for
losing their smoke at just the wrong moment.

In BA radios, the smoke is held within the transformers and resistors, and
sometimes the 'lytic caps. I've been there when it escaped.

Thanks for the feedback. I'm excited to try it out. I finally took the plung and tried some hardware mods on my DX-394, and it works great now. So I am thinking of trying to do some mods to the audio portion of this radio. Just for kicks. I just have to figure out how to do it. The DX-394 had a bunch of very detailed instructions for mods on the net. The DX-200 seems like a much rarer radio, and not as many people have messed with it. So I may have to experiment. But being a electronic newbie...it will be a learning curve. At least I have both the users manual with schematic, and the alignment and mantaince manual. I'm hoping it is pretty roomy to work in.

My DX-160 is also modded (though not by me) and while I can't testify to how it sounded before the mods....it sounds really nice with my headphones now. So I do want to try something with the DX-200.

I often wondered if an audio filter, or equalizer would help if hooked up to the radio. I wonder if you could adjust it to improve the bass response.

It is made the same way as all soaps are, you take a
fatty acid, and mix it with a strong base (lye) and
the fatty acid turns into a fatty salt (saponify) known
as a soap.

Thanks to all those who responded. I found it. After pulling the
main p.s. electrolytic and effecting no constructive change I
undsoldered and checked the *one* electrolytic on the line I hadn't
previously replaced...C19. It looked so new I'd figured the previous
owner had replaced it...but it was shorted. I replaced it and now have
normal bias and RF gain control operation...and signal thru-put on all
bands. There is still a lot of work to do to restore full original
performance, but it's "over the hump"

I'd always thought that with glowbottle gear, the smoke had to be
present, but kept out of the glowbottles. I suspect that's why so
many hams smoked, and how so many older rigs ended up with that golden
brown color distributed so evenly: they've supplied the magic smoke.

Hi,

I had a chirpy Apache at one time, and had luck
substituting a 6AH6 for the 6AU6 in the VFO
(both tubes have the same pinouts).
This trick appeared in 73 Magazine in the early 60's.

73,

I had a jack on the back that sent the audio from the pre-amp transistor
out and in back to the audio power amp IC. One of those things that short
when the jack is out for normal operation and you could plugin audio
processing equipment.

Since I maily DX'd Lowfers and aero NDB's with it, a high-Q filter was a
must. Worked good.

The normal audio circuitry in the DX-200 attenuates everything below 200Hz
for optimum voice reception.

Just goes to prove, you can NOT "ASSUME" anything. You always end up wasting time. It takes a minute to test an item to make sure, rather than waste an hour or more to only have to come back to it and end up kicking yourself because of it. Been there done that, I don't assume anything in a circuit anymore. Even if it does look new. I've had hunches about certain parts being bad, but assumed they were good only to find out I should have followed through on my hunch. So, I learned to check anything which could be suspect, especially initial hunches. It pays off and wastes little time. MNS

Exactly. As spamfiltering has gotten better, the spammers have gotten
more sophisticated.

The key clue is the attachment. Besides EXE files, ANY files with the
extensions COM, BAT, SCR, and PIF could also be damaging programs.
Note that sometimes a file will have a name ending in more than one
extension, but only the last one matters. More trickery.

Do not open any attachments that you have the slightest suspicion of,
no matter who appears to have sent them. A friend could have a virus
on their machine, sending out copies to everyone in their address
book.

Get a good antivirus program, including Norton Antivirus or MacAfee,
which gets frequent updates of virus definitions, and run it on EVERY
file received, via email, Internet, or disk.

The time and money you should put into prevention are a tiny fraction
of what could be involved in recovering from a virus on your machine.

Happy trails,
Gary (net.yogi.bear)

You forgot selenium rectifiers. You *don't* want to be around when the
smoke escapes from one of those....

Check out 'electric radio' and or am international on the google search
engine. The DX-100 has been changed and modified to the high nines and Im
sure you can find some info on it.

Aw gee...I wanted a Silvertone. They're bad, how? So...the Philco is solid
state? I think I might have seen one of those.

>
> So the 7BX10 is the other RCA TO? How is it different from the 3BX?
>
Almost identical electrically. The case is covered in plastic instead of
real leather (leatherette...same color). There's no band indicator, except
for the knob. The antenna pulls up instead of popping with a pushbutton.
The back panel is aluminum instead of plywood. Same size, a little more
modern styling of the front panel...wouldn't be able to tell them apart from
3' with the cover closed.
http://oak.cats.ohiou.edu/~postr/bapix/RCAstrat.htm

Then there's the 'alligator' 3BX which just went for $595 on epay...no
corresponding 7BX that I'm aware of.

and
> the 1L6 always pops when you turn on the juice :-) --Mike K.
>
My band indicator is kaput as well. In addition, someone mis-strung the
tuning cord so that the indicator only moves halfway across the dial,
although the tuning cap goes full travel. I've noticed that many of the
TW-1000's have a silver band that runs up the middle of the side pieces when
viewed from the front (the 2000 has a identical gold band). Mine doesn't,

and there's no indication it ever did. Does yours? Is it painted on, or is it an inlay in the leatherette?

I may go for a 'real' TO eventually...bid on several, but I'm concentrating on the knockoffs...much rarer, still relatively cheap. You can will me yours when you go...uh...wherever it is that you end up ;-)

Hi Folks:
A guy at work bought his old guitar amp to get looked at. The tech said he needed new tubes. (probably really doesn't). However, I needed to bring in my 833A and said he needed 2 tubes like this!! He was hysterical!
The tech and I got talking about BIG glass tubes. I was wondering if anyone knows of a bigger glass tube than 833a , 852 , 861, 4-1000a etc.
Thanks!
Harry

Hi:
I use to have an old TX-1! No crystals, just a 6AU6 tube in the
tuner that always had heater power, even with the power-switch off. I
think in CW, as long as it's in TX mode, even while unkey'd, the VFO
was running. It didn't chirp if I ran the finals under light load.
(low cap 'tune' - high cap 'load')
If I tuned it for max output at a given load, it would chirp.

Well, there's a ham who has a website of pics of his full-gallon rig,
with one _BIG_ Russian glass tube as the final, all out on 2x2 and 2x4
supports. I don't have that, but someone might remember it. It looked
like the tube was about 18" high.

The 849 comes close, if I recall the number right. When I was a kid in the 50s, our family knew the guy who maintained all the local airport radios. He brought me a lot of weak or blown tubes. The 849 was a classic -- over a foot tall, big metal plate cap. The filamanet was a wispy M shape held up by little spring-loaded clips on the ceramic frame inside. The tech said they only ran it about 150 watts, so it would last a *long* time. Probbly used in the LW beacons.

ISTR people made table lamps out of these bottles. 73, Mike K.

For Sale:

Ten-Tec Omni V Model 546 Series C Transceiver and Ten-Tec Model 255
Power Supply.....$800 plus shipping

This is an older, all solid state 160-10 plus WARC bands transceiver
made in the USA with digital readout and loads of other features.
Excellent working condition with 110 -120 watts on each band as measured
by my Bird wattmeter. Has CW filters. Has crystal for 30 meters but
does not have crystals for 12 and 17 meters. The insides are clean and
unmodified. The power supply also contains the speaker and is also
metered. Excellent cosmetic condition except for a small patch of vinyl
missing on the top of the transceiver and the metal speaker grill is
slightly bent on the left side. This can be straightened by disassembly.
These can be seen in the photos. This is a radio that you can still work
on yourself! Includes a photocopy of the manual.

Anyone know where I can get mine fixed? It has the original
speaker/power supply, Xcvr is the Black faced one.
Got in by a trade as my first HF rig, and yes, it was butchered by
putting in the 11 meter crystal for the 29mhz range. Has low to no
output on 20 meters (nothing on external power meter), low output on
80 meters (<50 w). No idea how it was treated before I got it, but is
is pretty grungy inside. I also have a set of schematics for it, but
I don't feel that comfortable working on the innards, what little
tweaking I attempted made 80 meters go to low output, and can't get it
back up now.

Anyway, sorry for the long rant. First CW and Phone contact with this
rig, would like to have it working as part of my small collection.
Use the usual techniques to reply via email.

Since we were sent home from work because of the
blizzard and have been snowed in all afternoon, I decided
to use the time to work on a web page I'd been thinking
about.
It's going to be all about Clough-Brengle equipment,
both test gear and transmitters.
It's far from being finished, but there's enough there
to be looked at. Check it out here,
http://radioheaven.homestead.com/CloughBrengle.html
There's more coming soon.

I shall have to look and simultaneously sympathize with your poor lot. I have but two small but wretched patches of ice left in the shadow of a bush. Rain, wind and near 50 highs have replaced the snow (but it did snow a foot at the ski hill 200 miles away). The lows did bring lots of slides on the roadways though.

Even better, store it as a .gif (4 bits = 16 colours greyscale) or .png.
Jpg is best for photo-realistic images, whereas .gif does best on line
drawings, text, other such high-contrast stuff. Png is somewhere in the
middle, trying to accomodate both within the same file format.

Cheers,
Fred

1393. FS: cavity for 829 tubes

Newsgroup: rec.radio.amateur.boatanchors
Date: 2004-02-27 00:55:05 UTC
From: kludge@panix.com
Message-ID: <c1m4h9$dc5$1@panix2.panix.com>
Source record: 25254

Relevant to the recent discussion on the 829 tube, I found an output amplifier module made by Bendix for the 460 MHz band. It _might_ have been hacked down to 440 MHz or I might never have got around to that. I did get around to mounting it in a Bud box with external cables for power and excitation. It's basically just a box with a cavity with an 829 in it. I don't remember how it was biased.

The first reasonable offer I get from someone who promises to actually try to use it will be accepted.

OK, I dug out my two pieces for model numbers. My frequency modulator or sweep oscillator is a Model 81-A. It takes the output from a conventioanl RF generator and heterodynes it into a swept output at an offset.

My RF generator is a Model 01, as far as I can read the messy stamping on the nameplate. It has a rotary turrent band selection, and a really sweet dual dial readout from 0-300, which must be translated by a calibratin chart built onto the top of the unit. Covers 50KC to 30MC in 6 bands. Very compact case, not heavy.

The 01 is AC/DC so I haven't tried to use it, but the 81-A sweeper has a power trans so I really should try it out -- I do like to align IFs by scope sweeping.

These units are pretty clean inside and out so would take great photos. Let me know if you want some shots. 73, Mike K.

Good suggestion. I've found that GIF is by far the best on B/W line drawings,
and even Microsoft Paint mitmap output with 4 or 16 colors, but I still mean
line drawings.

However, on a grayscale photo, even when cut to 16 shades of gray, I find GIF
files are bigger than JPG. Best is to try both schemes. pick the smaller file.

Don't know how much software can handle PNG format, though that may be the new
format that someone helped me test on my photo viewer last month.

Oh yes, I have two really old pieces of Clough-Brengle test gear -- a signal
generator with a rotary turret bandswitch (very compact, though), and a
motor-driven wobbulator sweep generator. They are both AC/DC, so I've been in
no hurry to try them out :-)

I assume you mean "there isn't any BFO *effect*". Things to check out:
*The BFO tube is bad;
*The BFO coil has an open winding (not likely, and defly not good!);
*The BFO coil slug adjustment is way off, so the BFO is oscillating outside the IF passband;
*The BFO switch is bad.

I don't recall whether this radio has a product detector. If you switch to BFO while tuned to an AM signal, do you still hear that signal, or does the radio go dead?

BTW, I have an HRO-60 that has been hacked on and lots of things don't work, so probably it won't help much in figuring out your problem. 73 es gud luck, Mike K.

The five wouldn't have a product detector, unless it had been modified.

I'm not even sure the 60 had one; I recall seeing an article about an SSB
adaptor that fitted in the socket intended for an FM detector, though perhaps
I am misremembering the HRO model.

I thought there was an HRO or two that did not include a BFO. Intended
for some specific use, it was a semi-custom version. I thought I had
read something about this, but like many things, I sure can't remember
where.

Now having seen the opening page graphic, I can tell it's a 2-color (B&W)
typewritten page, and it would certainly do much better as a GIF. Yes, it takes
a long time to load.

The transmitter photos also load slowly, but they are of superb quality and I
wouldn't mess with them! Looking forward to some test gear shots (I can
contribute some, as previously noted). 73 es tnx, Mike K.

It is a .gif, it only takes about 5 seconds to load here.

I'm working on some test equipment stuff.
The only problem is that to get scans that look
like anything, they're really BIG file.
And the scanned photos from the C-B catalogs
are really grainy.
I may just take some digital photos of my pieces
of C-B stuff.
I'll keep trying.

Hi Hank.

I have restored dozens of Cardmatics, and I am here in Oklahoma with
you. If money is an issue, I will certainly entertain the idea of
restoring yours and working out a trade for the payment.

On a related note, if anyone reading this has any junker USM-118B,
Western Electric KS-15874, or RD Instruments 1234 Cardmatic(s) I would
be interested. I am in need of several power transformers.

Does your scanning software have an option to do antialiasing on scans of BenDay pictures (pictures printed as zillions of teeny dots)? If yes, that can drastically improve the quality of the scanned image.

Very nice Ron. Makes me glad you had a blizzard. Not because
misery loves company, but because we share a similar interest
in Clough Brengle equipment. If you would like some pictures
of one of their scopes, I would be very happy to photograph mine
and send them to you via e-mail.

There's a bigger one too, but I can't remember the URL. It was used by an American propaganda station beaming programming to Cuba, IIRC. It's all glass, about 6' high and was a self-contained oscillator and 500KW power amplifier. Only three were ever made.

Mydoom.F just got into one machine here which had McAfee running and fully updated. McAfee then could not clean it. The free cleaner from Symantec (Norton AV) did the job.

You can build up all sorts of defences, or you can switch over to Linux, which I am strongly considering for this office.

Do you know for sure that the hum is being generated by the amp and is
not being passed thru from your transceiver?

Does this amp use 811A's?
You might check for open bypass caps in the tube's filament circuit.

Make sure you have the IF's aligned per the manual as the selectivity, sensitivity, and the slot depend on this. This is the same as with the HQ170, 145, and 180 that use all or part of the HC-10 circuits.

>scanned image.

That's a very handy feature of scanning software, and my HP includes it. An alternative is to scan at very high resolution (600 DPI), then use a photo editor with a Sharpen/Blur command to blur the way-oversize scan image just enough to merge the half-tone dots. Then resize it down to something reasonable.

If when you downsize it, you see aliasing bands, it means you didn't blur it enough -- go back to the big image and blur it some more, resize again, etc.

But I agree that, given a real live example of a piece of gear, better to grab the digi-cam and shoot the gear -- color, interiors, etc. 73, Mike K.

OK, thanks. The IFs seemed to be well aligned, so I didn't check their freq against a generator. The slot filter works on the 455 KC IF (the 160 doesn't have the 3rd, loew 60 KC IF that the 170 and 180 do).

In fact, my 180's slot filter operates at 455 KC, not 60, which seems odd but it works great.

Anyway, it's conceivable that my 160's IF is off, but it would have to be 10KC or more off to be unreachable with the slot filter adjustment. But, next time I have that radio off the shelf, I'll check the IF center freq. FWIW, the dial calibrations line up *very* well -- I did touch up the front end alignment, and the dial accuracies are worthy of a Hammarlund. Tnx es 73, Mike K.

>I am misremembering the HRO model.

You are right. My 60 has an accessory socket for the NBFM that National was promoting as an alternative to AM back when SSB was new, and yes, a previous owner built/bought an SSB box and plugged it in there.

>I thought there was an HRO or two that did not include a BFO. Intended
>for some specific use, it was a semi-custom version. I thought I had
>read something about this, but like many things, I sure can't remember where.

National did make special models for the FAA (CAA), etc., leaving off or adding some feature. Maybe the original poster has such a set. 73, Mike K.

Hi,
Do mean a mechanical hum in the amplifier?
if there is no sign of overloading (extra heat, extra current drawn),
it may be just a loose lamination in the transformer or HV choke.

73,
Ed

Time to replace a few 01As in that old-timey browser, huh Alan?

It doesn't render all that smoothly for me but I'm not sure why not. I think it has something to do with the large gif file being constricted rather than resized beforehand which would speed up loading and possibility eliminate the poor edging on the text.

It's just fine with me once I helped get the semantics and spelling fixed. I'm not going to nitpick about the "gap" in the box on the right side where the background unexplainedly shows between the text panel and the border. I think it's an interesting subject and hope you'll add to it soon. Reed Park and I think Lou G. want to add test equipment items to it and would be happy to talk to you. I think it has a lot of potential good use. Thanks for pointing it out to us!

Here's the same image after some tinkering....50k file size instead of 298k and it looks better to me.
http://www.sparkbench.com/CBtext1revised.gif

Not a problem for me, just a point of discussion.

Two things occur to me, Ron. First, only about 50% of web subscribers are using 'broadband' in the US, and certainly less in the rest of the world. So it still behooves one to opt for download time preference where it is possible and its a no-brainer if the quality can be better in the process.

Secondly, the format you are using constricts the image into a 'frame' and on a common 800x600 monitor thats resulting in about 50% compression. Might not look so bad on a 1024-wide format. Things like this always look better when blowing upwards as opposed to downwards. 800x600 still seems to be the norm these days.

"What-you-see-isnt-always-what-you-get" when it comes to folks with different internet connections, different size monitors, etc. I looked at the home page in both Netscape 7 (Mozilla) and IE. In my Netscape the "From a 1941 catalog..." is spilling outside of the box. Not a biggie but you can see the implications with some of the IE-only webpage designs. Optimizing for one browser only usually implies that it might not work with others. No need for things to be that way when a page can be made to work correctly on all browsers.

Regards,
Bill M

Sorry to be so late getting back to you on this. I had
forgotten I left a thread open over here on .boatanchors...

What really happens is the gas molecules (atoms) become
ionized due to the high plate voltage accelerating the plate-
current electrons to energies above their ionization
potential (typically 10 - 15 electron volts). When
this happens the now-ionized gas becomes a very good
conductor (almost a dead short) and the control grid
is totally ineffective in limiting the cathode-to-plate
current flow. The only thing that can halt the process
is the removal of the plate voltage. Unfortunately,
there is usually enough energy left in the conduction
electrons striking the plate to increase its power
dissipation disastrously.

This process is actually used to good effect in mercury-
vapor rectifiers and thyratrons because that "dead-short"
effect means the losses through the conducting tube are
low. Both of these devices "fire" (ionize) at some
forward voltage and then stay in conduction until the
AC driving them reverses polarity.

Just finish it. If somebodies' browser ***** it up maybe they'll be smart and read the INFORMATION instead of groaning about the format. I was pleased to help. Nobody ever built their webpages based on anything! I have ever said or done :)

Thats all well and good but the fact that you use IE doesn't restrict
you to webpage creation software that only works correctly for IE.
Its really a generic thing, not a matter of optimizing for one or the
other. Out of the 3 or 4 billion pages showing on Google only a small
fraction are "only works properly with IE". I've never seen a page that
"only works with Netscape".
Generic is best or we wouldn't be dragging out this thread.

Dave, you might try connecting a dummy load
and shorting the bias contacts of the amplifier,
to see if you get normal
resting current on the 811A's.
Also, look at the HV reading, and see how much it droops
with the bias contacts shorted compared to no load.

Have you tested the solid state rectifier in a tube tester,
same settings as the 866A.

> From here it looks like a page cut into a dozen parts with scissors >and pasted back together in random order.

I can see where you might get that idea -- one of the pages is a "collage" of various photos (gear shots, CCC station pix, catalog snippets, etc.). But the background framing makes it clear that's what you're seeing. Yes, the photos do take a while to load, but the final result is excellent. FWIW, I'm running IE and 1024 pixel screen.

As for GIF format, I DLed the blown-up copy of the transmitter schematic (wow, a separate driver-multiplier stage back in those MOPA days). As a JPG it was 110 KB. I converted it to GIF and it went down to 13KB! Almost 10 to 1.

As for the gear -- I got a kick out of the TX with the plate caps on the output coils for changing band taps. Neat idea. Luckily the power interlock switch is also very clearly shown :-)

Now Ibelieve I owe some test eqpt shots -- Mike K.

Most rigs have some power transformer or choke hum. In fact, my HX-50 hums louder as I crank up the RF drive -- and will probably "sing along" with voice peaks on SSB.

I briefly owned one of those HK linears. The main PS choke had an internal arc-over that pretty well drowned out any hum, and kept it from going on the air. But it was nice to watch those four 811s light up. --Mike K.

Happy to see that someone can read Italian.

I do not wish to explictly mention companies which one can easily find on the Internet.

Someone has envisoned an antenna generating E and H fields that are in phase, opposite to normal antennas having E and H fields shifted by 90 degrees.

Another funny thing is that, to obtain such shift, they put a reactive network in series with the antenna. It would be like saying that, putting a capacitor in series with a resistor, one can cause the resistor current to get out of phase with respect to the resistor voltage.

1464. A question about HRO 50/ HRO 60 coil interchangability.....

Newsgroup: rec.radio.amateur.boatanchors
Date: 2004-02-28 20:56:33 UTC
From: "Scott W. Harvey" <NOT_my_true@email.com>
Message-ID: <8qt140552rnphisifdllcuaqdtg8uddkvb@4ax.com>
Source record: 25225

I am trying to resurrect a rather threadbare military surplus National HRO 60 receiver that I got from a seller on ebay. It came with a single D coil set, which turned out to be a dud. The only other HRO 60 coil set I currently is a B coil set, so I have been using coil sets from a working HRO 50T to troubleshoot this rig on the lower frequency bands. The coils I currently have are:

HRO 50 "A" (14 to 30 Mhz)
HRO 50 "A" (14 to 30 Mhz) (spare)
HRO 50 "B" (7 to 14 Mhz)
HRO 50 "B" (7 to 14 Mhz) (spare)
HRO 50 "C" (3.5 to 7 Mhz)
HRO 50 "C" (3.5 to 7 Mhz) (spare)
HRO 50 "D" (1.7 to 4 Mhz)
HRO 50 "E" (900 to 2050 Khz)
HRO 50 "F" (480 to 960 Khz)

HRO 60 "B" (7 to 14 Mhz)
HRO 60 "D"(1.7 to 4 Mhz) (dud-not currently working)

After replacing all the paper caps and about 25 resistors that had drifted seriously out of tolerance (some as much as 50% to 100% off correct values) I now have a working radio. It works surprisingly well considering where I'm at in the restoration process (no alignment attempt has been made yet).

It has one curious problem though....When I plug in either of the two HRO 50 "C" coil sets (the only ones I've tried so far, since I've been working on the receiver at night), the dial calibration is way off, by about 300 kHz. Thus, WWV shows up at 5.3 Mhz on the dial. Plug the same coil sets into the HRO 50 and the calibration is right on the money, so it appears that both my "C" coil sets are properly calibrated.

I have already tried replacing the mica caps in the HF oscillator in the off-chance that something there was amiss, but the symptoms did not change.

Now, I already know that the HRO 50's "A" and "B" coils will not work in a 60 due to the second converter that kicks in at those frequency ranges, and I also know from reading previous posts to this group and elsewhere that HRO 50 coil sets for frequencies below 7 Mhz WILL work in a 60.

My question is, can the lower frequency coils from an HRO 50 be expected to behave exactly the same in an HRO 60 as they do in a 50

(same dial calibration in particular), or is there some subtle
differences that makes realignment of a HRO 50 coil set necessary
before it will work perfectly in an HRO 60?

-Scott

Source record: 25226

I just received a second one off E-Bay. The first one has some problems, looks good but wired badly, audio hum, but no signal . The wiring is immaculate on the second one, the guy did a really nice job. Now the problem, there are six added switches on the front panel of the second one. Looks like W9NJG built it as his call and SS number are ingraved. I doubt if he performed the mods. Big resistor network for a dummy load is mounted inside, added resistors.(in other words a mess) Also a big muffin fan was added over the finals.

The mods are the problem anybody know what they would do? One is labeled (in pencil) Lo Hi another has Spkr and I can't make out the other side.

The quandry is which one to save?

1471. NC 183D No agc

Newsgroup: rec.radio.amateur.boatanchors
Date: 2004-02-29 01:44:53 UTC
From: amfone@concentric.net
Message-ID: <c76750a5.0402281744.77269590@posting.google.com>
Source record: 25232

I have a very nice NC 183D works perfect but for one reason.
No AGC.. I must ride the RF gain to insure the receiver will not overload
on AM signals. The person I purchased it from said all caps had been
changed . I have not looked inside yet but if anyone can give me any advice
on how to fix this I would appreciate the info.
thanks

Ray,
Funny you should ask. I've been fixing up an HW-101 I bought years
ago ($20!), and I'm now using it as a backup rig. Actually, the
receiver performance is very impressive. I'm still chasing down
a minor AGC problem, but otherwise its fully functional.

Like your first one, mine was poorly built and I had to fight through
lots of cold solder joints and a couple of mis-wired circuits. Took
some time, but I enjoy this sort of thing. Cheap therapy!

I'd suggest using parts from the rig with the butchered panel
to restore the other one. BTW: the only mod mine has is a
fan bolted to the finals cage. Probably a good thing to have.

Good luck!

Steve W6SSP
p.s.-I heard a heathkit net on 20 meters last Sunday...didn't log the
frequency, but the time was about 1 PM PST. Might be worth
checking out.

This has been hitting the newsgroups in one form or another for some
time, usually carrying a virus or link to a malicious site.

I always wondered is any one ever fell for them.

>
>Do not open any attachments that you have the slightest suspicion of,
>no matter who appears to have sent them. A friend could have a virus

>file received, via email, Internet, or disk.

Even then, if it's an executable, the sender is some one you don't
know and if you do know them they don't verify they sent it on
purpose...Don't open it.

If your curiosity can't stand it... save the file, then run a scan on
it, but that still doesn't guarantee it won't take you to a malicious

site.

I don't have a photo of it, but I had a 6C21 on 80, 40, and 20. Twas a bear to neutralize. It looked like a 250 TH on steroids and was about 16 to 18 inches tall.

OTOH, there are many tubes in the multi KW range that are Huge. I've seen pictures of "walk in" tubes that had an air lock.

If you ever find those pics, _PLEASE_ scan them and put them up on a website somewhere, or mail the scanned images to me so that I can put them on mine.

ISTR my 173, which is the junior version but quite similar in tube lineup, uses
a separate IF stage to drive the AGC detector. If that tube is bad, or the
stage weak, you won't be getting AGC. Also, someone may have misaligned that
stage -- it's funny to align it, because the signal in the speaker gets weaker
as you peak the AGC driver.

BTW, anyone notice how *linear* the dials are on these Nationals? Check out
the BC band. 73 es gud luck, Mike K.

Bill, explain to me what you did to get it so small.
I'm sure I'll need to do again for some future page.
I have some Clough-Brengle catalog pages that
I'd like to put on, but the scans are more than 2 meg.
and still are hard to read the small text.

Thanks,

Ron

I resized it to 500 pixels wide - it was 1083 wide so that alone reduced the file size to about 25% of original. No point in having a 1083 pixel wide image that has to scrunch into the box provided on the page. That causes it to compress and may look 'funny' depending on a guys browser, video card, monitor, etc. At 500 pixels maybe it still compresses (or expands) a little bit. I can't tell from the script what the size of the rectangle is supposed to be but on my browser it appears to be about 500 wide.

Next I took it down from 8-bit/256 colors to 4-bit/16 colors. As mentioned before, thats a no brainer for a black and white image. That reduces the file size even further. Then just for looks I changed some of the 'almost' white or 'almost' black pixels to true black and white leaving the greys in the middle of the range.

For your 2 MB scans try something along the same lines. If they are 2MB it sounds as if they were scanned as color??. Get them into black and white for starters and gradually step down to 256 and then to 16 color black and white and see how they look. Old yellowed pages are sometime difficult to handle but there's ways.
After you get it looking good, resize it down to whatever width is appropriate for the page. If there's a lot of fine print you might not be able to get it as small as you'd like. The alternative here is to put a reduced size clickable link on the main page that can carry an interested surfer to a full size version. That way the main info page

doesn't get bogged down.
Crop the edges appropriately. You can often knock off a bunch of the file size just with simple cropping.
And if its a fine text page, don't try to put it in a box like the letter on the home page because thats gonna really scrunch down the fine print.

Hope this helps, drop me an email if you'd like to discuss it further.

-Bill, I scanned a Clough-Brengle model 110 catalog page,
it was in grayscale 300 dpi. The original scan was over
3 meg. I used Photoshop7 to reduce the from more
than 5K pixels wide to just 1000 wide. The file size was
reduced to about 125K and still looks great on the
web page. I may try going even smaller.

Thanks again.

FS Nice Drake TR5 Transceiver and matching Drake PS-75 Power Supply.
This is very clean gear cosmetically. It looks almost new. It does works,
but needs an alignment. Receiver sensitivity is low. Calibration is good
and the digital readout is bright and clear. Everything works. I have made
several contacts and get good audio reports. It puts out around 90 watts, a
little more or a little less depending on band. The rig includes the
original manual and all cables. Price is $675 plus shipping. Digital
pictures available. Thanks, Charlie Hugg, K5MBX

If you had taken it all the way to 2 colors (B & W) the GIF compression would really have been something. FWIW, the enlarged schematic of the 4581 TX compressed instantly to 12K, though still 841x411. Although the original was a full-color JPG, there were apparently only black and white pixels in it.

When converting to GIF, GIF has to figure out ahead of time how many unique colors re in the image, and it quickly found there were only two, so it went to B&W GIF, which is very efficient. --MikeK.

I tried. It started looking crappier rather than better. Thats why I
went after the 16 grey colors one at a time. Couldn't pull it off.

1508. Hallicrafters s-38C question

Newsgroup: rec.radio.amateur.boatanchors
Date: 2004-03-01 05:35:09 UTC
From: screw@inorbit.com
Message-ID: <f255646c.0402292135.54e20748@posting.google.com>
Source record: 25169

Hey folks, got a question: I just bought a S-38C and have replaced most of the resistors. I will be replacing the rest of the capacitors this week. I've also replaced all 5 tubes with new ones from AES. The radio does work a lot better than it did when I first got it, but two problems remain:

1) I only pick up 3 local AM stations (I live in downtown Washington, DC.) Is this something I should be concerned about? I am new to all of this, and I am still learning... but it seems to me that this radio should be picking up more than 3 stations. I have a pretty big antenna attached to it, so I'm pretty sure that's not the problem. Is living smack-dab in the middle of downtown the reason why I can't pick up any AM stations besides the local megawatt monsters? Or might the poor reception be due to the fact that there are still 5 wax capacitors that haven't been replaced? Bands 2 and 3 pull in tons of stations; band 4 only pulls in a few but I'm not worried about that.

2) When I first got the radio, it worked but not very well. The bandspread tuner worked fine, but after I operated it for a few hours and then turned it off and started ripping out caps and resistors for replacement, the bandspread didn't work the way it used to. Now, it tunes just fine from 0 - 70, but when you turn it past 70 a very loud crackle is heard, and then there's nothing but a soft buzz. If you turn the knob back down below 70, the stations come back. Besides this problem, the bandspread tuner works like a champ.

I've been having a great time restoring this thing, and learning from my mistakes. I've got a shipment of the remaining capacitors that I couldn't find at AES coming to me this week from Mouser... when I'm done replacing those, there won't be much left to replace!

Thanks.
chris

Yes. You should also carefully clean the bandswitch, along with other controls such as volume, etc.. Corroded/gunky contacts on the bandswitch are an almost-universal problem in multi-band radios that have been sitting around for a long time. DeOxit spray cleaner is a favorite among restorers. You can also use spray tuner cleaner from Radio Shack, etc.

I think (uh oh) #1 could be due to the caps or front end
desense/overload.

#2 - Did you check the tuning cap on the bandspread to see if any
vanes were shorted or bent?

I have the S-38B, just guessing.

The S-38 series was not all that sensitive, being basically an All American
5 with no RF amp.

But in downtown DC? You should get way more than 3 stations.

What do you have connected to the antenna terminal?

I have for sale three relay rack cabinets in very good condition.
They are located about 90 minutes from me in Jackson, Michigan, and
you must pick there.

I am not certain if they are 19" or 24" .... I will confirm later this
week. These are part of an estate I purchased, and I have no need for
them.

Best offer, please.

Thank you.

Cyberterrorism is a real concern. Should a Windows vulnerability be exploited and take out significant numbers of systems, it would be an advantage to have your station fully operational, including all digital modes supported by your computer. So it has a lot to do with amateur radio to have a robust computer.

I don't think so. You should hear dozens of AM broadcast stations.

> Or might the poor
> reception be due to the fact that there are still 5 wax capacitors
> that haven't been replaced? Bands 2 and 3 pull in tons of stations;

Yeah, don't jump to any conclusions until you've replaced the
capacitors. And be sure the alignment is correct. The RF aligmnent can
be way off on the top three bands and the radio will still recieve
stations because these bands have little RF selectivity. The alignement
on the AM broadcast band is more critical.

> problem, the bandspread tuner works like a champ.

One, or both, of the plates on your bandspread capacitor is bent. These
plates are very vunerable due to their length and position. You might
be able to spot the bent plate by carefully eyeballing each plate as it
rotates into it's closed position. If it goes off center between the
fixed plates, it's probably touching the fixed plates. A bit of gentle
bending will put it right.

It's best to close up the band spread cap whenever servicing the radio.
Especially when replacing the 12SA7!

If you need any alignment tips, fell free to ask. You can do a good job
on this radio without a signal generator!

True, that usually happens to a scanned B&W document. If you reduce it to 2 colors, the lines and letters break up around the edges. Using 16 shades of gray permits "aliasing" to fill in the breaks so the eye sees it as smooth.

You were right to stop at 16. I just wanted to point out that the typewritten sheet in the home page really is already 2 colors (B&W), having been expertly scanned and worked over by someone. Likewise the large schamtic for the TX. Both these should make good 2-color GIF.

Er, I'm not really certain aobut the opening sheet -- but I did save and check out the TX schematic, so know it's 2 color already, and compresses almost 10:1 under GIF.

It's typical that Bands 2 & 3 will pick up plenty on a simple radio, and typical that Band 4, which is usable only during daylight hours, will be weak on a 4-tube radio without an RF amp stage.

But the fact that Bands 2 & 3 are so alive, points out that what ever's wrong with the AM BC band 1 is peculiar to that band, and not the radio as a whole, that is, not the remaining wax caps (which you still want to replace anyhow). AM BC is an easy band for even the simplest radio to receive well. My guess is alignment, or dirty bandswitch contacts (spray them with Deox-It, don't waste your time with Rat Shack tuner cleaner). Good luck, Mike K.

It's not bulletproof at all, but it doesn't have severe design deficiencies
at least. They'll still keep finding buffer overrun problems in Linux, but
we won't be seeing the sort of boneheaded design flaws that Windows has.
The real problem is that the Windows issues aren't being fixed, they are just
being patched around and obscured.... and then the next virus comes along.
Until the fundamental problems get fixed, it's not going to get any better.
With Linux, at least there are routes to get that sort of problem fixed if it
should appear. I'm no Linux fan, but it's sure a big step up in terms of
unified design.

To which I'll add that the malware writers are reverse-engineering the
Wondows patches to see what the vulnerabilities are, and then writing
and disseminating exploits for those vulnerabilities, secure in the
knowledge that some large fraction of the Internet-connected Windows
machines around the world will be running unpatched Windows.

Open source is, IMHO, far preferable to that situation. I don't run
Linux at home, and at work we run AIX, FreeBSD or Linux (up-to-date)
on all machines exposed to the raw Internet.

Had a total computer meltdown and lost all my web sites & favorites. I had a link to a supplier of Hammarlund paint and clock lenses, in Wisconsin I think??

They had different colors for different models, spray cans and quarts, and clock lenses and parts.

Does this ring a bell with anyone? IIRC, they didn't have online ordering, you had to phone or snail mail. Any help would be appreciated!

Also, I'm looking for the top two screws for the cabinet of an HQ-180AC, the power supply filter cap for a 180AC, and the screws that hold the cabinet back to the chassis for any of the larger HQ's.

Thanks,
Clay

Message-ID: <4043f958$0$3070$61fed72c@news.rcn.com>
Source record: 25191

Hi Nick,

rrab is supposed to be a discussion group, but by general
custom it has become a pretty much anything goes group.
The general theme should have something to do with tube
rigs, or very old SS rigs.

I won't even touch the top posting vs bottom posting
conventions. Whichever style you pick will please some, and
upset others.

It is suggested that your Subject line have some indication
that reveals commerce postings. For instance:

Subject: FA - for auction
FS - for sale
WANTED - what it says
WTB - Wanted To Buy
WTD - Wanted

This allows the guys that hate the commerce use of this group to
skip those sorts of postings. Don't ever make the mistake of
using FS on an auction. You *will* get cored.

It would be nice to indicate generally what the subject of your
post is in the subject line too.

(eg. FA - Heathkit SB-123 or
Help me fix my Beefy-123)

Some folks get ruffled when the commerce listings are by people
who never contribute any technical content to this group. So
it would probably be best to join the community before you try
and clear out your garage here.

I offer this information only as a synopsis of my observations
of the culture of this group.

Welcome!

-Chuck Harris

I have no idea how comparable they are, but I have an S-38E
which I rarely turn on. On the AM band, just south of San Francisco,
it gets about four dozen stations with only a three foot piece of wire
for an antenna. The other three bands are kinda sparse right now, but
I can hear at least a few clear stations on each.

I've had it since about 1955, I think. Nothing has ever been
replaced on it, but it has been kept in the house all that time, never
left out in the garage or other unfavorable storage condition.

The S-38s are not very good AM band performers. The reason bands 2 and 3 sound so "alive" is usually because of severe image rejection problems.

It's not uncommon on these radios to receive 31 meter band station images between 8 and 9 MHz that are almost as strong as the primaries between 9 and 10 MHz. The higher the frequency goes, the worse the image problem is.

Therefore, you're receiving each station twice, making it sound like the band is more alive than it really is.

Hello Chris,I think you should examine the RF coil assy. and check for open circuit in BC input...think about this, If this receiver had an external antenna connected and was sitting there on the BC band,turned off,and a lightning charge came along it would most likely burn out the BC RF coil,making it extremely weak on that band..I have seen it happen many,many times. if the ant winding is open ,just take some small wire,like 28 Ga. and wind about six turns on the form as an antenna primary .. should work OK good luck W4PQW

1540. Help needed Yaesu FT-757GX! How does the VFO knob come off?

Newsgroup: rec.radio.amateur.boatanchors
Date: 2004-03-02 23:25:30 UTC
From: Bubba <xbubmanx@rogers.com>
Message-ID: <cn5a405c8c6mfehufno758telbn9rn5d02@4ax.com>

How do you get the VFO knob to come off? Do you just pull? There is no screw on the knob itself. The VFO knob is now so loose it's impossible to tune so I have to get in there. Any help appreciated! TIA!
Bubba

1541. RAFFLE OF DRAKE R7A; updated list

"I believe" it was the old VOA station. "It seems" like there was a story on it wayyyy back in QST. Maybe in the 60s or 70s.
OTOH it could have been one of the very high powered VLF stations. At least those are a couple of good places to start.

I remember the photo, but it's been a long time.

I have the following items for sale that are excess to my needs. Prices
do not include shipping. I will ship overseas.

Solar Capacitor Exam-eter Capacitor Checker.......$80 plus shipping
This is a multi-function vintage capacitor tester which tests
capacitance, resistance, power factor, leakage, and insulation
resistance. Also has an ac/dc VTVM built-in. This is a working unit in
nice condition. Includes a copy of the manual.
http://members.cox.net/radiostuff9/exameter.jpg
http://members.cox.net/radiostuff9/exameter2.jpg

Heathkit IG-42 Signal Generator...................$30 plus shipping
This is the higher end signal generator from the 1960ï¿½s with shielded
compartments and better performance than the lower end Heathkit signal
generators. Covers 100 kHz to 30 MHz in 5 bands with both CW and
modulated CW functions, a step attenuator with steps in microvolts,
adjustable modulation and jacks are for external modulated source No
manual but they are available from several sources. Unit works in the CW

mode but modulation does not work.
http://members.cox.net/radiostuff9/heathig42.jpg
http://members.cox.net/radiostuff9/heathig422.jpg

Heathkit SG-6 Signal Generator.................$20 plus shipping
Nice compact working unit covering 160 kHz to 150 MHz in 5 bands.
http://members.cox.net/radiostuff9/heathsg6.jpg

Weston Electric Vintage AC Voltmeter and AC Ammeter.........$45 plus
shipping
These are neat bakelite meters that must be 50-60 years old. Voltmeter
covers 0-300 Volts in two ranges through two separate binding post
connections. Ammeter covers 0-20 amps in two ranges.
http://members.cox.net/radiostuff9/ac_meters.jpg
http://members.cox.net/radiostuff9/ac_meters2.jpg
http://members.cox.net/radiostuff9/ac_meters3.jpg

Precision Apparatus Series 85 VOM.........$30 plus shipping
Vintage well built VOM. Tested and working.
http://members.cox.net/radiostuff9/series852.jpg
http://members.cox.net/radiostuff9/series85.jpg

Triplett 630-PL VOM..............$25 plus shipping
Nice working VOM. Needs new battery for highest resistance scale - all
other ranges are OK
http://members.cox.net/radiostuff9/triplett2.jpg

Nye Viking Phone Patch.....$25 plus shipping
Working unit in excellent condition with cables.
http://members.cox.net/radiostuff9/viking_patch.jpg

RCA Advanced Voltohmyst VTVM.....$40 plus shipping
Older RCA VTVM in working condition with probes. Case has been repainted

and a metal handle has been added.
http://members.cox.net/radiostuff9/rca_voltohmyst.jpg
http://members.cox.net/radiostuff9/rca_voltohmyst2.jpg

Weston Antique Milliameter.....$30 plus shipping
This is a neat antique meter. Working in very good condition. Measures
15, 75 and 300 mA through separate binding post connections.
http://members.cox.net/radiostuff9/weston_meter.jpg
http://members.cox.net/radiostuff9/weston_meter2.jpg

Book - "The Portable Radio in American Life" .....$25 plus shipping

This is a 260 page book published in 1991 covers the history of portable
tube radios and transistor radios from the 1920's to the 1970's.
Includes historical information on Sony, Zenith radio,
Admiral radio and many other brands who built portable radios. This is
an excellent reference book if you collect portable and transistor
radios. These are new books. This is a great radio reference book. I
have 1 of these books left.
http://members.cox.net/radiostuff9/portableradiobook.jpg

Set of crystals for the Navy TDQ transmitter...$60 plus shipping
Their are 24 crystals of which 23 (a few duplicates) are the original
Navy crystals; one crystal is not. The wooden box is in great shape
also. Here are the frequencies all in MHz: 5.80,12.90,13.10, 13.26,
13.50, 13.74,13.75,
13.82, 14.02, 14.02, 14.30, 15.62 ,15.64, 15.66, 15.68,15.78,15.84,
15.85, 15.86,15.86,15.86,15.92,15.92, 16.00, 16.24
http://members.cox.net/radiostuff9/tdq_xtals.jpg
http://members.cox.net/radiostuff9/tdq_xtals2.jpg

Amiga 1000 Computer System with Goodies .....$50 plus shipping
Includes the computer, floppy drive, mouse, keyboard, user's manual,
printer cables and software. This is all untested. There is no monitor
despite being shown in the photo.
http://members.cox.net/radiostuff9/amiga_comp2.jpg

Most likely you are remembering the plate coil and capacitor output network of
one of the old Navy VLF stations. I remember photos of a big room full of the
inductor and some capacitors that looked like they'd hopped off telephone
poles. The room had copper plated walls and an interlock on the door to cut
the juice if someone opened it.

I doubt there were ever walk-in tubes. The vacuum required for any kindof tube
life is so "hard" and pure that you wouldn't be able to pump out a whole room
to that purity. Though maybe with a really big "getter" ... Mike K.

This is good advice -- check that primary.
I'd like to add that many antenna primaries get blown out because someone discovers that a ground makes a pretty good antenna -- because it's using the hot side of the house power wiring as an antenna. If your line bypass caps are leaky, you'll get excess AC current thrut he antenna to ground -- I've seen sparks thrown, not big fat ones, jsut enugh to let you know it isn't good for the coil.

And if you have a fancy antenna system with a baluyn coil, then for 60 cycle AC, the "hot" antenna lead is as good as ground, so be sure to hook up the ground side first. Which is just hte opposite of what PL-259 coax connectors do ,,,

Hello!

In order to restore to its full glory a nice couple of NC-183D
receivers, I need some knobs. As I have two units to restore, I need
about a full set.

I could use also an S-meter or, at least, its cover (round metal + plastic)

Please, check on http://jvgavila.com/nc183d.htm for details on my work.

Thanks and best regards,

JOSE

1559. Bridge Megger Tester. Series 2. 500 Volt.

Newsgroup: rec.radio.amateur.boatanchors
Date: 2004-03-03 10:31:46 UTC
From: john_c@tpg.com.au

Source record: 25119

Hello All,
I have googled around the net hoping to find
some information like an operators/repair booklet
for a Bridge Megger Tester. Series 2. 500 Volt.
Made by Evershed and Vignoles.
No luck yet.

Plenty of info on really old models but not much info
on 30 year old models.

This model has two rotary switches under the leather
carrying stap.
one switch is labled Bridge Insulation Varley
The other switch is a 5 position reistance multiplier switch.

On the side opposite the winding handle there are
three terminals Earth Line Varley Earth

The instrument works well for insulation testing.
Resistance measurement in the Bridge mode works
but not very accurate. There are four switches
that have ten positions. 0 to 9 so the accuracy
should be good.

"Varley Test" I dont know anything about this.
Just wondering if anyone can shed some light.

www.megger.com say it is too old. No help there.

Thanks for reading, all info appreciated.

Regards,
John Crighton
Sydney

Hi,
John asked:

>"Varley Test" I dont know anything about this.
>Just wondering if anyone can shed some light.

Without looking it up, I think the Varley Loop test was to find shorts in underground cables, from resistance ratios measured from each end. A google search for "varley loop" turned up some likely texts.

I have this image of someone walking in through the airlock with a
big container of cesium or strontium, to be used as a getter, and
hooking it up to a pair of terminals on the inside of the tube once
it has been baked and pumped down for a while.

I also have this image of an enormous induction heater, with coils
completely surrounding the tube, forepumps the size of modern fanjet
engines, and diffusion pumps slinging kiloliters of oil per second.

Somehow, I think it's just not viable.

Hi

Thanks to Larry and Steve for checking and telling me that it takes 9 revs. . I took the drum out and apart yesterday and determined that it would do 9 turns, there's ten tabbed washers.. The dial drum mechanism is well made and quite precise. Someone else had had this unit apart and screwed up the timing on the washers. My crank had some binding that wouldn't go away. I disassembled the drive unit and found some galling in the rear bearing. After cleaning out a few brass filings, smoothing the rough spots inside the bearing and applying a very light coat of grease it didn't bind and is velvet smooth for the whole nine turns. The worm drive is well made with dowel pins for alignment and a ball bearing thrust washer to adjust. Since I moved both the capacitor and Helipot I now have to figure out if I can recalibrate it. I think I've got the Helipot part thought out at least, but I need more time on the capacitor. Since it's a ten turn pot I assume that 250 ohms must be left at each end and the drum centered at 2500 ohms. On the lowest range, 5 to 100 pF, the Helipot isn't used to balance the bridge. A 15 to 150 pF variable capacitor paralleled with a 1.5 to 7 pF trimmer is used. The substitution method is used and I assume that the dial is calibrated so that the unknown capacitor and the variable capacitor add up to 200pF so that when the bridge is balanced the ratio of the fixed arm at 2000 pF is ten times the sum of the unknown and the variable. The other leg is a 75K and 750K fixed resistor giving a ten to one ratio. Any tips appreciated.
I originally thought the 5K Helipot was bad because when I checked it with my Fluke 87 the resistance of the unit appeared erratic and jumped as I turned the wiper. (I only had 6 turns too!) After I got the drum out I put 50 volts on the Helipot and the voltage varied smoothly and didn't jump. Had I better eyes or watched my Fluke more closely I would have noticed that it changes scale automatically and randomly somewhere before 500 ohms and starts readings in decimal kilohms. So at say 398 ohms it jumped to 0.56 K ohms as I turned the shaft. I'm relieved to find that the Helipot, a SC-234 is good because I couldn't find anything on the Internet as a replacement and it has the shaft at both ends!

The Varley Measurement was used to locate crosses, shorts and grounds on open wire leads and then later in buried cable. Few different types of "Varleys", 3 wire, 4 wire, loop to ground (wet paper insulated lead cable)and the "Miller Varley". Was darned accurate if you had the forethought to make "turn-up" readings on the lead (and record them)when it was new wire, giving you a benchmark to work from. All required a "strap" at the far end and if possible, one good wire out to the strap. But, it was all based in math and percentages of length.

I once hit a fault in a 7.2 mile section of buried .375 Coax within a foot with my old testboard bridge. But, took a day of measurements and few pages of math.

I've worked both ends......cable testboard and out in the field.....30 years. Just send big ole' lineman down the road 150 miles in the middle of minus 30 degree weather to knock the "wraps" out of a wire lead.......miss your measurement by a few poles or force him to snowshoe off into the brush looking for trouble that's not there. Believe me, you heard about it!

Had one big lineman....he was a monster, come into the testroom with his hooks still on. Was looking for my boss. Seemed the foreman had made a trouble location for him while we were gone to break. Poor guy, the measurement was about 1.5 miles off......snowshoe job for sure. Man....he was HOT. I was young then......always made my measurements twice....hee.

>Bubba

Hi Bubba,
As I recall, there is actually setscrews to loosen..
If you look at the part of the knob your fingers actually turn, you
will see that it is a knurled rubber. If you carefully peel and pull
it from the back, it will slide foward, exposing the setscrews.. Its
kind of like a wide knurled rubberband around a piece of aluminum..
Hope my old memory serves me right! Best 73 OM... Tony

I had a HW 101, sold it to my brother, to get a Kenwood TS440 S-AT. While I'm not going to say the Kenwood is a bad radio, it isn't.. I love the audio of the "tube" rigs. The glow and so on, seems to add a bit of nostalgia. As soon as I get a chance, I'm going to buy another HW 101 to put back on my desk.

FWIW - here is a cure I came across once with my HW101. After warm up, as the set was being used, the bands (all of them) would drop out starting at the low end of the dial. Since I operated mostly on 10 meters, it took time for it to get to that frequency from the low end, to drop out. The first time it dropped out, I had no clue why. I turned it off, it cooled down, set was ok til warmed up again. I checked all the bands to find out what all was going on. I figured it had to be in the VFO. I took the VFO cage off and there was a resistor just barely touching the chassis with it's lead. I bent it away from the chassis and that cured the problem. It's kind of weird how or why it happened and when. I bought the rig used and used it for a year before that started. It wasn't bumped around alot either, as I kept it on my desk. Weird..... CL

There are all sorts of ways of locating cable faults.

My most accurate location was on a 15-mile length of recently laid cable which from the symptoms was most likely at a joint. I obtained the records of the job, looked up the names of the jointers who had worked on it, and aked the contractor's engineer who was his worst jointer.

The fault was at the first joint we opened.

..... My guess is alignment, or dirty bandswitch contacts (spray them with Deox-It, don't waste your time with Rat Shack tuner cleaner).
Good luck, Mike K.
>

I just reworked an S-38C for a co-worker. Along with the dirty switch contacts several of the grounds to the chassis had corroded and needed to be cleaned up. The wipers on the tuning caps needed attention too. My shop antenna is a 35ft wire at the apex of the garage roof. With that hooked up the little guy does great on shortwave broadcast, 75mtr AM etc. With no antenna it gets all the local stations.

I can't figure how a problem in the VFO would cause that. The VFO tunes
the same frequencies for all bands. The conversion is made to the
various bands by mixing with crystal controlled local oscillators.

Well, it did. I did as I said and the problem was cured. Hey... I didn't believe it either! It made no sense. It isn't the first time I've seen weird things happen that beat theory or logic. I've stopped believing that what most say can't happen - won't. But why I went to the VFO was due to the "tuning dropping out - the way it was happening". Just made me think to look there first - lucky hunch maybe, but it paid off. CL

I suppose it is possible that the mixing action of the HFO requires
more power out of the VFO on some bands than it does on others. Perhaps
the shorting cap dropped the output of the VFO enough so that it would
work only on the 10 M band. I would have thought it would go the other
way, though.

Years ago, we on the news group got someone to run off a batch of Hammarlund clock lenses. I needed one for my HQ-180, and bought two just to have a spare. I'll sell the spare for $15 ppd. in the USA.

I am looking for someone who may have a manual or other information on the Gonset Commander model A. I seem to have gotten a model A, and the only manuals I can find are for the B and C models. My real problem is that the modulator tubes are missing, and I don't know what they are. The B and C models use two 7C5's, but the set that I have uses two miniature tubes. Any help will be greatly appreciated. Thanks, Greg Gifford / KG4MMY

I didn't miss seeing the end-tag. Many people who post have one or more
infirmaties, and draw attention to it only when it is necessary. This post got
my attention because it used keystrokes that require the use of the shift key
(not shift lock key), indicating that its use was optional, regardless of the
comment in the end-tag.

Now that you have a stone clad reason for messing with the guy, consider
this:

How were you harmed by his all caps message?

Suppose it added 10 minutes to the length of time it took for him to
compose the message just to add in the "optional shifts?" Ever watch
a disabled person use a mouth paddle to work a keyboard?

Suppose it made him feel nice in a kind of Model 15 teletype sort of
way to use all caps?

Either way, how were you harmed?

Give the guy a break. Maybe one day you will need us to give you one.

Hey Nick, shipping receivers of this size is very practical, as long
as you follow a few simple rules.
1.)Use a good sturdy box big enough to contain the radio and the
layers of padding that will surround it. A computer box makes a very
good container.
2.) Remove all tubes and wrap them individually in bubble wrap, and
place them back into the interior of the set because, chances are,
they will vibrate out of their sockets on the trip and wind up broken
and useless.
3.) Wrap the radio itself in at least 2 layers of bubble wrap. This
will keep the radio from receiving "rub marks" and other damage caused
by movement, and will provide a layer of padding for the more
breakable parts.
4.) Surround the radio with at least 3 inches of rigid styrofoam board
insulation on the sides and top, with 4 inches on the bottom, making
sure that the radio is held firmly in place by the packing, and not
allowed to move excessively.
5.) Tape the box securely on the outside by continuously wrapping
bands of overlapping packing tape to reinforce the box.
6.)Lastly, even though this part won't make much difference, clearly
mark the outside of the package as "FRAGILE!" in several conspicuous
places. I like to think that this will give the monkeys at your chosen
carrier a little pause before they start to use your package as a
throw toy!
I have shipped many heavy sets using this method, including a
Hallicrafters SX-28, a National RBL-5, a National HRO-60, and several
others, and all arrived safely in the condition in which they were
sent. The rigid foam board costs about $7.00 a sheet, and can be had
at any home improvement store. Be sure to get the rigid board with the
plastic coating, and not the plain styrofoam, because it will take
much more abuse without breaking. Also, UNDER NO CONDITION SHOULD YOU
USE PACKING PEANUTS!!!!!!! These cursed things will shift and become
useless, and, if the set is not wrapped properly in bubble wrap, they
will end up hopelessly wedged into every nook and cranny in the

interior of the set! I hope this helps.

I'll add my 2 cents worth.
1. When it comes to bubble wrap, use the stuff with big bubbles, not the tiny stuff like they sell at the Post Office.
2. The styrofoam stated is great for keeping the box intact but adds little to cushioning so that makes Item 1 even more important.
3. I personally prefer double boxing but on a large item that may send you into the "Oversized Parcel Post only" cost stratosphere if shipping via USPS. Double boxing is well worth the effort. Chock the corners of the box-in-a-box with wadded up newspaper, heavy foam or something to keep it centered and the rest can packed tight with peanuts, etc. This really helps for the inertia damage like the power xfmr bending the chassis when the parcel makes an abrupt stop.
My credo is that if I'm not comfortable to throw, drop or otherwise abuse the parcel then its not fit to go into the "system".

Thanks everyone for the advice. I have since replaced all but one of
the wax caps and lamentably, the AM band is totally shot now. All I
get are two very strong stations and then WMAL, which I used to get
fine, is all but dead (it usually comes in at 630 AM, but now for some
reason it is tuning in at 500 and very very faint...) I'm a total
novice at this but I guess it doesn't take a novice to realize that
this thing is horribly out of alignment. I am really going to need to
teach myself how to do an alignment. I just hope I don't electrocute
myself! ;-) Does replacing capacitors necessarily throw a radio's
alignment completely out of whack like this?

I hope I used the right kinds of capacitors to replace the old wax
caps. Although I am positive I ordered the right values (voltage, mmf,
etc.) and triple checked everything when I replaced the old ones, I
hope I got the right type of materials. I got mica caps from Mouser
and AES when available, but there was one caps that I got that is a
"polyester film" capacitor.

Also a question about tolerances -- how important is it to get a capacitor with the exact tolerance? When I'm looking up part numbers, sometimes a capacitor won't list any tolerance at all; other times, a tolerance is listed (Say, 10%) and that's the only one they have with the voltage/farad spec that I need, but the radio's parts list requires a 5%. Will performance/safety be affected adversely if I go with a capacitor with a 10% tolerance instead of the required 5% ? Maybe it's a silly question, but it's hard to find some of these tolerances, at least in my experience.

Thanks for putting up with these questions.

Questions are never silly. Well, maybe sometimes :-) The variances between say an .05 and a .047 are nil. You could recap the whole darn radio with .01 or .02 and rarely notice a difference.

You're looking for the fly on the elephant's butt while ignoring that he's in the room (Yeah, I heard that from Bill Maher). I'm going to give you credit for having chosen the correct value caps and putting them in the right place but CHECK THAT ANTENNA COIL and CHECK THOSE TUBES if you haven't done so already.
Has anyone mentioned that maybe you should check the antenna coil for continuity? If not, I'd recommend checking the antenna coil. Checking th antenna coil would be a good idea. Maybe it has a problem and checking it would allow you to confirm or refute that common problem. Schematics are on nostalgiaair.com and BAMA. Get dirty with the radio, don't try to rationalize it. Check the antenna coil or better still check your own work and then CHECK THE ANTENNA COIL.

I just purchased a Hammarlund HQ-150 receiver for restoration and use with a kit built synchronous-am detector to listen to medium and shortwave broadcasts. By pure happenstance, it turns out that the HQ-150 comes with an outboard unit made in the mid-1950s by Central Electronics called a "Sideband Slicer". The "Slicer" appears to be, among other things, some kind of unit for injecting a locally generated and phased carrier signal into a received AM signal for improved reception. Is anyone out there familiar with the Sideband Slicer and how it's the same or different than today's synchronous-am detector circuits?

I don't know where you get that impression.

A "Sideband Slicer" is an adaptor for making an old receiver better able
to deal with SSB. So not only is it a product detector, but you get two
of them because it uses the phasing method to remove the unwanted sideband.
It's not as good as an IF filter to cut down on bandwidth, but it did help
when the receivers it was used with had AM-bandwidth selectivity, and
some RC and LC networks were cheaper than a mechanical filter.

It connects to the end of the IF strip of the receiver, and there is no
RF coming from the unit back to the receiver. I'm not sure how it hooks
up, but if there is an output it would be an audio signal so you can use
the receiver's audio output stage. There is no synchronization because
it's for sideband.

There were apparently two models, with the "B" model including a Q-Multiplier
for peaking or notching the incoming signal.

The scheme was first described in a ham publcation in 1951, and then various
companies offered up their own commercial versions. They date from a time
when there weren't receivers specifically designed for SSB, though as
that decade continued various manufacturers did start to produce receivers
with product detectors and better selectivity for SSB.

The phasing scheme is seen in some selectible sideband synchronous detectors,
but in both places it only offers a means of nulling out the undesired
sideband. The actual synchronous circuitry is elsewhere, and "Sideband
Slicers" and their siblings from other companies did not include such
circuitry since they were to improve SSB reception. Circa 1958, you did
see descriptions of synchronous detectors with selectible sideband (again
using the phasing method) in the ham magazines, but as far as I know nobody
produced a commercial version in the tube era.

From: j.toneyjr@att.net
Message-ID: <777334db.0403050947.9368617@posting.google.com>
Source record: 25074

Hello;

I have the above set, unfortunately, the center coil in the 2.7-6.4 range has a broken wire and I cannot repair it. This is the "1st detector coil" in the manual. There is a large coil about 3/4" in diameter; in the bottom of this coil form is a screw that attachs the coil form to the sliding assembly. This screw goes thru a smaller coil form with very small wire, almost hair-like. This coil has one end of wire broken off flush with coil of wire -- impossible to even find the end under magnification.

So, I am looking for either a replacement from a junker, a complete sliding assembly with all the parts intact or a junker set. Can anyone help?

Jim

It's not that difficult.
Where I used to work we had vacuum chambers large enough for to get
in. We ran those down to 10^-7 torr.

OTOH we had some mass spectrometers that used ion pumps in addition to
the mechanical roughing pumps and the diffusion pumps.

Once past about 10^-2 torr, most of the molecules cling to the
surfaces and are basically scrapped off with the diffusion pumps.

After that there isn't a lot for the ion pumps as the things lasted
for years.

Course if we managed to burn out one of the induction heating coils
which was water cooled, it took days to clean up the mess.

You know it's gonna be a bad day whey there is water coming out the
roughing pump exhaust.

We once had a failure on the midnight shift that wasn't caught right
away. It filled up the entire exhaust system for a big room full of
float zone refining equipment. Now that was expensive.

Does anyone know where I might find a replacement for
the OMRON relay in the TS-820? It is not the antenna relay
but the one which switches the IF and other circuitry between
transmit and receive.

Thanks for the information. I found a copy of the Sideband Slicer manual
online, and what it talks about permitting is exalted carrier reception of AM
signals, not synchronous detection.

All you need is 6.3 vac @ 900 ma and 135v dc @ about 10 ma or so. I
think a Stancor PA8421 xfmr will do the job nicely, and I'd add an
OD3/OA2 as well to regulate the B+ voltage for better stability.

Any good handbook would have a simple power supply design easily used.

The Surplus Radio Conversion Manual Volume 1 has a major article on
the BC221, and volume 3 has one on the similar Navy LM freq meter, and
these have AC power supplies included.

The SX101 is a fairly decent receiver that matches the HT32A
transmitter, and I'd say the going price will be somewhere in the
$100-250 range depending mostly on condition, etc.

The TA-12 is mil surplus and probably worth far less than $100 except
to a serious collector.

Your value will depend a lot on condition, and whether it is
operational or not.

Beware of E-pay listings, as they tend to be higher than the hamfest
market.

Usually they don't fail unless abused i.e. not tuned properly, causing
excessive plate dissapation.

Internal elements occasionally fail and short, such as grid to
cathode, or screen to plate, any of these can cause symptoms as you've
described.

Since a new set of finals seems to have cured the problem, I wouldn't
worry about the exact mode of failure, just treat the new tubes with
care and they should last for years.

Looks like a commercial AM radio of some sort dating from around the mid 20's. Look for some sort of markings in the chassis as as clue to who manufactured it.

The box on top might be an accesory audio PA, as they were not a common item in those days. Most people still used headphones.

Hi Irv...

I've searched diligently but have been unable to find a direct replacement. There is an Omron that is close but will require some socket rewiring to work. If you can't find it let me know as I have it written down somewhere. I've got to run off to work right now and don't have time to look for it.

73, Roger

General info to the group -

Several months ago someone here was lamenting the fact that, although calculators which convert Lat./Long. to Maidenhead Grid reference are very common - they could not find any which convert Maidenhead Grids reference to Lat./Long. Recently, I found one which converts in both directions. It may be accessed at: www.amsat.org/cgi-bin/gridconv

Hi Mike,
That mod should apply to all of the 51J series receivers. I know
for sure that it is on the J3 and J4, and on the R-388 version of the J3.

1628. Wiring Standard for 1/4" Mic Plugs?

Newsgroup: rec.radio.amateur.boatanchors
Date: 2004-03-06 04:41:19 UTC
From: knudsenmj@aol.com.Oscar
Message-ID: <20040305234119.29815.00003588@mb-m21.aol.com>
Source record: 25089

Is there an agreed-on way to wire a PTT mike to a "stereo" 3-conductor 1/4" phone plug/jack? Based on past experience (KWM-2, NCX-3), I'd say it is:

Sleeve (ground) -- common to mic audio and PTT switch
Tip (end) -- PTT switch, close switch to trip TX relay and transmit
Ring (middle of shaft) -- mic audio hot

However, I found a nice Shure PTT mike that's got the common ground to Ring, mic audio to Sleeve, and PTT to Tip. Should I rewire this beast, or is this really the "standard"? Hard to imagine audio hot going to Sleeve, but who knows?

Hope to reach a conscnsus before I repair the wires on my D-104, one of which has broekn off. Thnx es 73, Mike K.

Chris,
Let us know where you are located and maybe someone from the list who lives nearby can meet with you and share some of their experience showing you how to debug a problem radio in a systematic manner. If that doesn't work out, get a copy of an old tube radio servicing bk (Marcus wrote some classics) and read up on what each stage does and what the symptoms to look for are. A new book called "All American Five" is also very good. Your enthusiasm is good, but some assistance may help. By the way, the S-38 series has a "hot" chassis so use what is called and isolation transformer when working on and using it. 73 Mike KF6KXG

Source record: 25092

I've had to clean mine a few times, and this has restored proper operation. Assuming your relay
is not damaged, you may want to try cleaning the contacts. I use a small piece of copier paper, and slide
it between the contacts. You may have to put some slight pressure on the contact mating surfaces so
that the friction with the paper burnishes the contact surfaces.

If the paper comes out with a dark streak, then you have removed carbon from between the
contacts. I've had it come out streaked, and clean, but both times it repaired the relay function.

I did that Tom, but thanks for the tip. I consider the TS-820, 830, and 520 series to be some of the best rigs ever built. My assessment is based on my experience as a navy tech for 26 years, and then Sony tech for an additional 14. The only regular problem I've encountered in these units has been that darned relay. In every case I've cleaned the relay and restored operation. I currently run a TS-520S and figure I can keep it alive as long as I live. I'm not sure just how many times you can clean a given relay, and wouldn't mind having a spare on hand. I have encountered other problems, usually just a faulty driver or final tube, and then usually a result of overdriving -- but those are easy fixes. What I do like are the circuit boards -- well made and easy to repair if required. The only circuit board repair I ever had to do on a Kenwood was a blown regulator which was the result of someone sticking a screwdriver into the rig and shorting a line!

Enough rambling....

Hi Irv,

I would have to look at the contacts to be able to make a
true prognosis, but typically if the contacts aren't snagging
the paper (eg, not badly pitted), you can clean them indefinitely.

I would modify Tom's cleaning regimen to use typing paper dipped
in 91% isopropyl alcohol. The alcohol will remove any oils or greases
that might, for what ever reason, be on the contacts.

If the contacts are pitted, then you need to do some more work. Take
an old hacksaw blade, and grind off the teeth, and make the width a
little wider than the contact. Then very lightly grind the flat faces
of the blade to thin it down, and to make fine scratches perpendicular
to the blade's length. Kind of like a very fine file. Don't even think
about using a file, or any kind of sandpaper!

Use this new burnishing tool to polish down the pits. Keep the contact
crowned in shape. When you are done, use compressed air to clean the
metal flake out of the relay, and then clean the contacts with isopropyl
alcohol. You don't want any oil on the contacts.

After you do this, the contacts should be good to go for another 5-10
years.

-Chuck Harris

No, you can talk thru the mic into my HX-50 and hear it on a receiver, and clicks come out of the mic when you apply an ohmmeter, so I guess the cart is still good.

The wrong wiring -- I think we agree it's wrong, and my "standard" is the right way -- looks to be factory original. The wiring at the mic end may have been messed with, but at the plug the shield is wiried to the ring, not sleeve -- darned if I ever saw that anywhere. Can't be right.

BTW, the Hammarlund HX-50 doesn't want to do PTT by shorting a terminal to ground -- instead, it insists that the two PTT terminals be shorted together to trigger the relays. So no way to run PTT thru a 3-circuit jack.

Has anyone had the occasion to remove the key pad from the top of the keyer case. Does not appear to be an easy way as it is stuck on with some form of contact cement.

Why does it need to be removed???

Well, several of the conductors in the printed ribon cable which connects the key pad to the main pcb have gone open circuit and the keyer is useless.

From your description, the two microphone leads are correctly connected (one to the ring and the other to the sleeve), but ground is connected to the wrong lead. In my opinion that is just a mistake.

I presume that the microphone cable is shielded. Looking at the jack, if the braid is connected to the ring, then the mistake is surely on the jack wiring. If the braid is connected to the sleeve, then the mistake is presumably on the internal microphone wiring.

Verifying whether PTT works on not would be another element to determine where the error actually is.

You do know that there is only one filter for both USB and LSB?

The other slot is for CW. If USB doesn't work, the problem is
probably the carrier crystal, switch, something like that.

Message-ID: <20040307151659.01632.00001204@mb-m03.aol.com>
Source record: 25013

In article <k1C2c.9705$O31.454860@news4.tin.it>, "Antonio Vernucci"
<vernucci@tin.it> writes:

>From your description, the two microphone leads are correctly connected =
>(one to the ring and the other to the sleeve), but ground is connected =
>to the wrong lead. In my opinion that is just a mistake.

Yes. What it had was the audio shield and one PTT lead connected to the ring.
I moved those to the sleeve, put the hot audio on the ring, and left theother
PTT lead on the tip.

>I presume that the microphone cable is shielded. Looking at the jack, if =
>the braid is connected to the ring, then the mistake is surely on the =
>jack wiring. If the braid is connected to the sleeve, then the mistake =
>is presumably on the internal microphone wiring.

Yep, it was miswired at the plug (jack), not at the mic end.

>Verifying whether PTT works on not would be another element to determine =
>where the error actually is.

And now the PTT works fine in my Viking II, which a previous owner had added
PTT to. The audio also works hum-free, both in the Viking and the HX-50.

Now to figure how to get the HX-50 PTT to work by grounding one terminal --
appears not to want to work that way.
Tnx es 73 -- Mike K.

1653. 75m AM party last nite via W1AW

Newsgroup: rec.radio.amateur.boatanchors
Date: 2004-03-07 20:16:59 UTC
From: knudsenmj@aol.com.Oscar
Message-ID: <20040307151659.01632.00001203@mb-m03.aol.com>
Source record: 25014

Last evening (Sat), I lit up the Racal 17 just to read the mail on 3880 AM while I rewired a mic plug. What did I hear but a booming signal signing "W1AW". What's this, the ARRL on AM?

Sure enough, two visitors from 6-land had been guest operating, and after everyone else went home they decided to see if the bran new Icom 7800 would do AM. It did, what a signal, thought they had an old Collins.

Dozens of AM stations lined up to work them. I tried to get in, but the Viking II was not percolating too well into the antenna tuner, so I had to settle for working a ocuple of the other guys while the guest ops took a supper break.

Here in Maine, I could copy (but not work) stations from my home digs of Central PA. Anyway, it was inspirational to hear how many AM ops are around, especially with a little "League" (unofficial) leadership.

1654. Resonant HV Secondary Windings?

Newsgroup: rec.radio.amateur.boatanchors
Date: 2004-03-07 20:33:24 UTC
From: knudsenmj@aol.com.Oscar
Message-ID: <20040307153324.25517.00004665@mb-m15.aol.com>
Source record: 25015

This may be OT but could apply to some high-voltage transformers that supply hihg-powered TX finals.

Does anyone know why the 4 KV secondary of a medium-sized transformer used in an electrostatic precipitator air cleaner should have a 0.01 uF cap across its secondary? My suppy failed when this cap opened up. Without it, only a small fraction of the voltage was developed across the two diodes and 0.08 filter caps in a voltage-doubler circuit that produces about 8 KV at up to 5 mA.

When I replaced it with half the original value, a 0.047 6KV cap from an old color TV parts bin, I got enough DC output to draw a 1/4" arc. But when I paralleld a second such cap, to pretty much equal the original value, I got a 3/8" or more arc, and the transformer made buzzing noises like it was really doing some work.

I permenently soldered in the two replacement caps and put the air cleaner back together. It works good as new again. Oh yes, I added a fuse to the primary side, just in case my new caps short out. Odd there wasn't one already.

Anyway, I at first thought that shunt cap was just to protect against line spikes, but apparently it tunes a resonance in the secondary winding, or something. Has anyone else encountered such a cap? Obviously a dangerous place for a cap to be, so I can understand this isn't used often. 73, Mike K.

Yes, I listened to that for a time too. It was cool. Unfortunately, after the W1AW op went to supper, the conversation degenerated into a bunch of guys trying to run everyone else off 75 meters. It was funny for a while, until it just became pathetic.

I hadn't listened to 75 in a long time, and finally put up an inverted vee to give my new TS 2000 a test on that band. Hadn't been on the band in about 12 years, and figured most of those types of guys had finally died off. Guess not.

I didn't hear it that way. The guys who filled in between the W1AW break were taking breakers and "check-ins". A lot of them knew each other, of course. There were a lot of carriers from guys tuning up, and breakers tromping on each other, naturally. Some of the double and triple heterodynes were like a singing commercial for SSB :-)

But I didn't take anything as rude or exclusive. There are of course plenty of professional LIDs on 75 who need less testosterone and more medication, but they are no way confined to AM. In fact, I feel a lot "safer" running AM on 75 than SSB.

1661. OT: Open Letter from a Green Beret to John Kerry

Newsgroup: rec.radio.amateur.boatanchors
Date: 2004-03-08 18:28:44 UTC
From: David Stinson <arc5@ix.netcom.com>
Message-ID: <404CBB09.6030600@ix.netcom.com>
Source record: 25022
Cross-posted to: rec.radio.amateur.boatanchors,rec.radio.amateur.policy

From Green Beret Officer Don Bendell

The old hurts are surfacing and the feelings of betrayal by fellow citizens, and their leader stirring them up, are breaking my heart again. I am being cut in the same scar. How did we who served in Vietnam suddenly become cold-blooded killers, torturers, and rapists, of the ilk of the Nazi SS or the Taliban? Most of us were American soldiers who grew up idolizing John Wayne, Roy Rogers, and all the other heroes. That was why I volunteered. But for political expediency, John Kerry has rewritten history, again. After spending only four months in the country of Vietnam, John Kerry testified before Congress in 1971 with these exact words about incidents he supposedly witnessed or heard about from other vets: "They personally raped, cut off ears, cut off heads, taped wires from portable telephones to human genitals and turned up the power, cut off limbs, blown up bodies, randomly shot at civilians, razed villages, shot cattle and dogs for fun, poisoned food stocks, and generally ravaged the countryside of South Vietnam."

I was a green beret officer who volunteered for duty in Vietnam and fought in the thick of it in 1968 and 1969 on a Special Forces A-team on the Ho Chi Minh Trail, just for starters. We were the elite. We saw the most action. Everybody in the world knows that. But we did not just kill people, we built a church, a school, treated illnesses, passed out soap, food, and clothing, and had fun and loving interaction with the indigenous people of Vietnam, just like our boys did in Normandy, Baghdad, Saigon, and everywhere American soldiers ever served. We all gave away our candy bars and rations to kids. Our hearts to oppressed people all over the globe.

My children and grandchildren could read your words, and think those horrendous things about me, Mr. Kerry. You are a bold-faced, unprincipled liar, and a disgrace, and you have dishonored me and all my fellow Vietnam veterans. Sure, there were a couple bad-apples, but I saw none, and I saw it all, and if I did, as an army officer, it was my obligation to stop it, or at the very least report it. Why is there not a single record anywhere of you ever reporting any incidents like this or having the perpetrators arrested? The answer is simple. You are a liar. Your medals and mine are not a free pass for lifetime, Senator Kerry, to bypass character, integrity, and morality. I earn my green beret over and over daily in all aspects of my life.

Eight National Guard green berets, and other National Guard soldiers, have been killed in Iraq and Afghanistan, and you totally dishonored their widows and families by lumping National Guard service in with being a draft-dodger, conscientious objector, and deserter, just so you can try to sabotage the patriotism of our President who proudly served as an Air National Guard jet pilot. I have a son earning his green beret at Fort Bragg right now, and his wife serves honorably in the Air National Guard, just like President Bush did, and I am as proud of her as I am my son. I volunteered for Vietnam and have no problem whatsoever with President Bush being our Commander-In-Chief. In fact, I am proud of him as our leader.

John Kerry, you personally derailed the Vietnam Human Rights Bill, HR2883, in 2001, after it had passed the House by a 411 to 1 vote, and thousands of pro-American Montagnard tribespeople in Vietnam died since then who could have been saved, by you. Earlier, as Chair of the Senate Select Committee on MIA/POW Affairs, you personally quashed the efforts of any and all veterans to report sightings of living POW's, when you held those reins in Congress. You have fought tooth and nail to push for the US to normalize relations with Vietnam for years. Why, Mr. Kerry? Simple, your first cousin C. Stewart Forbes, CEO, of Colliers International, recently signed a contract with Hanoi, worth BILLIONS of dollars for Collier's International to become the exclusive real estate representative for the country of Vietnam.

"Hanoi John," now that it works for you, you beat your chest about your Vietnam service, but to me, you are a phony, opportunistic, hypocrite. You are one of those politicians that is like a fertilizer machine: all that comes out of you is horse manure, and you are spreading it everywhere.

Medals do not make a man. Morals do.

Don Bendell

Canon City, Colorado

Its a tank circuit, an economical way to get high voltage at low current.
The concept is used in pi network filters of B+ supplies, a capacitor tunes
the filter choke.

Original message:
> From: David Stinson <arc5@ix.netcom.com>
> Subject: OT: Open Letter from a Green Beret to John Kerry
> (copy of editorial by Don Bendell snipped)

Mr. Stinson, are you employed by, a volunteer at, or otherwise associated with the Bush for President campaign?

It's interesting to note that when I did a Google search of "Don Bendell" the first site that comes up is titled "Welcome to Bendell Enterprises": it has a link to Mr. Bendell's agent prominently displayed on the page. The fact that Mr. Bendell is, as a Republican spokesman, so obviously (you'll excuse the pun) "bush league" is indicative of how desperately the Republican National Spin Meisters are trying to find anything or anyone who will denigrate Senator Kerry's war record.

No matter: Mr. Bendell was there, so I'll give him the benefit of the doubt. I doubt that his recollection is the only valid one of that place or time, and I also doubt that he has the one true account of Vietnam. Loyal service, even as part of an A team, does not grant an old soldier the right to rewrite history.

I was there, too: and everything John Kerry said is true.

That Mr. Bendell didn't see it doesn't mean it didn't happen: he is entitled to support and protect the memory of his comrades, as am I - but not at the expense of whitewashing what others have documented. Yes, some soldiers _did_ cut the ears off VC dead. Yes, some soldiers did other unspeakable things: just ask Rusty Calley if you don't believe me. Some of it, I saw with my own eyes, some I read in the courts-martial and/or arrest reports I saw as a Military Policeman.

Mr. Bendell is entitled to be proud of his relatives who are in the National Guard, especially in peacetime when there's little chance they'll be put in harm's way - and I am entitled to hold someone who is standing for election to a higher standard. The rich and powerful have a greater obligation to the ideal of service than do ordinary men and women, and Shrub wasn't there.

Whatever Mr. Bendell's perception of the Vietnam war is, he's not entitled to shoot the messenger who first brought the ugly, sad truth to America's attention in a way that could not be denied or swept under the rug. That John Kerry chose to leave the war zone early is no shame: nobody who's been shot at blames another for taking advantage of the "three strikes" rule, which spelled out early return for a sailor who was wounded three times. Only an former General Officer like President Eisenhower could tell the

military brass "I will not send one American boy into that elephant grass", and for the same reasons, only a decorated commander like John Kerry could have founded Vietnam Veterans Against the War.

At a time in our nation's history when the rich and well connected were scurrying to park their sons' yachts in safe backwaters, a well connected young man raised his hand, took an oath, and took everything that came with it. You can't fake that kind of courage, and you can't spin his opponent's kind of cowardice. John Kerry was there.

Bill Warren

P.S. Readers are invited to cross-post this to any newsgroup where Mr. Bendell's editorials are appearing.

P.P.S. FWIW, some soldiers did kill dogs: the unfortunate animals couldn't read signs, and those that were lucky enough to wander through a minefield unscathed would, sad to say, leaves tracks that Viet Minh sappers could follow. I did, too: in my case, as a courtesy to our Vietnamese workers, who wanted them for food but were unable to participate in butchery because of their religeous beliefs.

(William Warren is a pseudonym I use to protect my privacy. I will respond with my actual name to anyone who asks offline: modify the return address in an obvious way to email me directly. I don't work for the Kerry campaign, or the government, or the Democratic party, and have never even met the Senator.)

THE FOLLOWING ITEM APPEARED IN A NON-PARTISAN (BUT EXTREMELY
CYNICAL) NEWSLETTER FOR INVESTORS. THE NEWSLETTER HAS BEEN RELENTLESSLY
CRITICAL OF BUSH ADMINISTRATION ECONOMIC POLICIES.
And now this about `Lucky Jack Kerry` from a source we`re not sure we
can reveal, said to be a retired Rear Admiral:

`I was in the Delta shortly after he [Kerry] left. I know that area
well. I know the operations he was involved in well. I know the tactics
and the doctrine used. I know the equipment. Although I was attached to
CTF-116 (PBRs) I
spent a fair amount of time with CTF-115 (swift boats), Kerry`s command.

`Here are my problems and suspicions:

(1) Kerry was in-country less than four months and collected, a Bronze
Star, a Silver Star and three purple hearts. I never heard of anybody
with any outfit I worked with (including SEAL One, the Sea Wolves,
Riverines and the
River Patrol Force) collecting that much hardware so fast, and for such
pedestrian actions. The Swifts did a commendable job. But that duty
wasn`t the worst you could
draw. They operated only along the coast and in the major rivers (Bassac
and Mekong). The rough stuff in the hot areas was mainly handled by the
smaller, faster PBRs.

(2) Three Purple Hearts but no limp. All injuries so minor that he lost
no time from duty. Amazing luck. Or he was putting himself in for medals
every time he bumped his head
on the wheel house hatch? Combat on the boats was almost always at close
range. You didn`t have minor wounds. At least not often. Not three times
in a row. Then he used the
three purple hearts to request a trip home eight months before the end
of his tour. Fishy.

(3) The details of the event for which he was given the Silver Star make no sense at all. Supposedly, a B-40 was fired at the boat and missed. Charlie jumps up with the launcher in his hand, the bow gunner knocks him down with the twin .50, Kerry beaches the boat, jumps off, shoots Charlie, and retrieves the launcher. If true, he did everything wrong.

(a) Standard procedure when you took rocket fire was to put your stern to the action and go balls to the wall. A B-40 has the ballistic integrity of a Frisbee after about 25 yards, so you put 50 yards or so between you and the beach and begin raking it with your .50`s.
(b) Did you ever see anybody get knocked down with a .50 caliber round and get up? The guy was dead or dying. The rocket launcher was empty. There was no reason to go after
him (except if you knew he was no danger to you just flopping around in the dust during his last few seconds on earth, and you wanted some daring do in your after-action report). And we didn`t shoot wounded people. We had rules against that, too.
(c) Kerry got off the boat. This was a major breach of standing procedures. Nobody on a boat crew ever got off a boat in a hot area. EVER! The reason was simple. If you had
somebody on the beach your boat was defenseless. It couldn`t run and it couldn`t return fire. It was stupid and it put his crew in danger. He should have been relieved and
reprimanded. I never heard of any boat crewman ever leaving a boat during or after a firefight.

`Something is fishy.

`Here we have a JFK wannabe (the guy Halsey wanted to court martial for carelessly losing his boat and getting a couple people killed by running across the bow of a Jap destroyer)
who is hardly in Vietnam long enough to get a good tan, collects medals faster than Audie Murphy in a job where lots of medals weren`t common, gets sent home eight months early, requests separation from active duty a few months after that so he can run for Congress, finds out war heroes don`t sell well in Massachusetts in 1970 so reinvents himself as Jane Fonda, throws his ribbons in the dirt with
the cameras running to jump start his political career, gets Stillborn Pell to invite him to address Congress and Bobby Kennedy`s speechwriter to do the heavy lifting, winds
up in the Senate himself a few years later, votes against every major defense bill, says the CIA is irrelevant after the Wall came down, votes against the Gulf War, a big mistake since that turned out well, decides not to make the same mistake twice so votes for invading Iraq, but oops, that didn`t turn out so well so he now says he really didn`t mean for Bush to go to war when he voted to allow
him to go to war.

`I`m real glad you or I never had this guy covering our flanks in Vietnam. I sure don`t want him as Commander in Chief. I hope that somebody from CTF-115 shows up with some
facts challenging Kerry`s Vietnam record. I know in my gut it`s wildly

inflated. And fishy.`

1668. WWVB decoder circuit

Newsgroup: rec.radio.amateur.boatanchors

HI,

Does anybody have a circuit that will
decode the WWVB signal,and output to a clock
led circuit?

TIA,

Dennis

(unatributed rant snipped)

They really ought to give you GOP PR types a quick course in Netiquette before they set you loose on the world: your ALL CAPS post shows you haven't been associating with the hoi poloi for a long time.

Let's see, where can I start:

"Organization: Posted via Supernews, http://www.supernews.com. "

Nice one! No inconvenient IP address to trip you up. Win 98, too, at least according to your headers. You guys _do_ occasionally learn from your mistakes, don't you?

"Non partison (but extremely cynical) newsletter for investors..."

Wow, I'm impressed. In terms of FUD and intimidation, that's at least a 5 out of 10. I can't question your honesty because I'm not an "investor", and I'm ashamed to admit that I don't hang around with non-partisan and cynical newletter types. Way to go, GOP PR man!

"The newsletter has been relentlessly critical of Bush administration economic policies".

Oh, of course, and that's -so- easily verifiable, given your thorough coverage of the "newsletter" and it's background. I'm just brimming with patriotic left-wing fervor now that I know your "newletter" is "critical" -

nea, "relentlessly critical" - of shrub and his let-them-eat-dog-food economic policies. I'm all warm and fuzzy, you've won me over, I trust you without reservation. With the issue of your background, credentials, agenda, and employer settled, let's get to the good part.

"...from a source we`re not sure we can reveal, said to be a retired Rear Admiral..."

Ah, jeez, Mom, can't I meet the Real (sorry, "Rear") Admiral? Can I? Huh? Puhleeze?

I can't reveal *my* source, but (s)he said that it was really a retired corporate huckster collecting corporate welfare from the big island in Hawai, who dusts off his traveling salesman cap and majik elixar bottles every four years when the oil boys throw enough money at him. Trust me: my source is just as unimpeachable as yours!

"1) Kerry was in-country less than four months and collected, a Bronze Star, a Silver Star and three purple hearts. I never heard of anybody with any outfit I worked with (including SEAL One, the Sea Wolves, Riverines and the River Patrol Force) collecting that much hardware so fast, and for such pedestrian actions. "

Hmmm - "collecting" is a nice choice here: it infers that Kerry didn't deserve that "hardware", but leaves me a little flat on the impedimenta of how he "collected" that "hardware" without his commander and (IIRC) four other senior offices certifying that he deserved it. Oh, well, let's not get bogged down in details like exactly which Admiral's rear this came from.

BTW, that use of "pedestrian" is first rate FUD: it infers that nobody was really shooting at anybody, nobody got wounded, nobody killed, nothing much except the usual humdrum routine of having men in black pajamas shoot at you with - heaven forfend! - real 7.63 mm ammunition - instead of the deadly innuendo and poisonous slander that Kerry's own countrymen would shoot at him 30+ years later.

Of course, in the world of big oil, big banks, big "investors", and big lies, only the ungrateful and unapreciative working man - like me - would be so rude as to ask why this "Rear Admiral" didn't come forward way back when. Only someone who didn't understand the winks and nods that those-in-the-know trade during $5,000 per plate dinners could possibly be so impertinent as to ask how an arrogant, rich, drunk daddy's boy could have the gall to hire you to slander a reputation built on blood and deeds, when his was built on daddy's money and a PR firm's expertise.

It's a great country: only in America could someone type out bald-faced lies and not mention that Shrub was, depending on which version is currently being floated, either in Alabama, Arkansas, or Georgia - but not Texas, where he was supposedly assigned. Only in America could an unnamed, unavailable, unattributed "Real (sorry, 'Rear') Admiral" be created out of whole cloth so that the oilmen could grasp for another four years of let-them-eat-dog-food.

Shrub was drunk, although the details are, uh, foggy.

John Kerry was there.

And that, Mr. PR expert, is for attribution.

Bill Warren.

Go to Google and search for "atomic clock". In the first 20 or 30
listings you should find hobbyist sites that have diagrams and maybe
even kits.

You might want to search at http://www.google.com using the terms wwvb decoder clock. There's plenty to select from and a number of kits available.

Hi,
Unless you want to have fun building a clock, there are many such clocks
or watches out there. I wear a watch. Very accurate in time keeping.

I've never read "Front Page Magazine", and it's qualifications as an "Non partison (but extremely cynical) newsletter for investors..." remain open to question. The appeals for money on the splash page leave me to wonder which investors it's appealing to, but for the sake of argument, let's assume they really are an actual magazine with a meaningful readership.

The story you cite begins with the line

"The following was sent to a Marine chat net by a retired Marine Master Sergeant
who was in S-2, 3rd Bn, 1st Marines, Korea in 1954."

But, from there, it is a copy of the smear attributed to a "Rear Admiral" in your original post. I don't believe it was actually posted by a Marine, either: there's too much wrong with it.

1. The gratuitous reference to Korea, and the way in backfires on the PR man:

I don't know if being in the "3rd Bn., 1st Marines" has some cachet amoung Marines, but it smells like FUD put in to catch the eye of a key swing vote - older veterans. Anyone in Korea in 1954 would have to be at least 68 years old now, and I have never seen anyone of that age group participating in something as new as a "chat net".

2. "I know the tactics and the doctrine used, and I know the equipment. ".

This doesn't make sense: why would a Marine be trained in small boat tactics? What "doctrine" is he talking about? How would a Marine learn about Swift boats or PBR's, when the Marines pride themselves on being combat infantrymen and not "Rust pickers"? Don't forget, he'd have been an Sergeant

at the time of Vietnam, only ~30 years old: hardly an age or rank that would be expected to cross-train with Navy boat crews. More to the point, how many Marine Corps Master Sergeants would write like that?

3. Finally, the coup-de-grace that reveals this to be just more disinformation: "The details of the event for which he was given the Silver Star make no sense at all."

If whoever wrote that was actually a Marine, and had actually been in combat, he'd know that nothing ever goes according to the book. When the shooting starts, men revert to their most basic capabilities, and if Kerry chose to confront an attacher directly, instead of running away ("put your stern to the action and go balls to the wall") that speaks volumes about the fact that he put himself first in the line of fire. I don't doubt for a second that it wasn't the correct "Standard procedure", but procedures are designed by statisticians who want commanders to do what will give the greatest probability of success in an average encounter. Kerry threw away the book and did it himself instead of risking his men's lives: that's why he got the medal.

This all smells: second and third-hand slander, without a name attached, without confirmation (something a real "magazine" would be expected to do routinely). I don't believe it.

Of course, the Republicans hope it doesn't matter: having thrown the manure in front of the fan, they're hoping that it will stick to Senator Kerry and he'll be too busy cleaning it off for anyone to trace it back to the source before the election.

Concerning your earlier post:

> You're not real fond of opposing opinions are you?

I welcome opinions of all sorts, whether or not they support my viewpoint. So long as the sources are available, I'll accept quotes without prejudice, too.

Mostly, I'm "not fond of" Shrub's attitude that not being caught in a lie is the same thing as telling the truth. What I am especially "not fond of" is unattributed slander, quotes-out-of-context (as you did to me), nameless and unverifiable attacks, or the attitude some people take that it's OK to question Senator Kerry's courage while forgetting George Bush, Junior's cowardice.

Bill Warren

The answer IS simple, and it is that Kerry was a young, impressionable, idealistic junior officer with a boat and crew to care for, and with a dangerous and thankless job to do, and what were undoubtedly "Latrine Lawyer" fables at the time he heard them got lost in the noise until they were later verified by those who participated or those who apprehended the participants. I don't care when Kerry realized that the stories were true: I care that he had the guts to act on those truths.

As I said before, Mr. Bendell is not the guardian of the "one true version" of Vietnam history. His stipulating that he "saw none" just before bragging that he "saw it all" is understandable: old veterans, both he and I, each have our own version of the truth as we saw it, or (more accurately) as we remember it.

It happened. You don't need to take my word for it: look up the courts-martial records and interview the convicts who did it. Of course, the "30 old white men" who run America are counting on the likelihood that nobody will bother.

Oh, sorry, I thought we were having a discussion about politics: you appear to be reciting a speech by Juan Peron.

Call me back in ten or twenty years: if your "friends" stay in power, you'll be living in a tent, choosing between buying food or medicine, and you'll own nothing but the TV set your masters will use to tell you what to think.

I pity you.

Bill Warren.

Ok, then, take Kerry's own quotes and ask why he refuses to release his
military medical records to the pundits to 'prove' the PHs that got him
out of Nam in four months.

And while you're at it, see if you can find a copy of his book - you
know, the one with the upside-down American flag on the cover.

What we don't need in the White House is another liar or hypocrite and
his self-proclaimed "war hero" status raises some serious concerns about
his integrity.

You're having way too much fun with this topic and clearly you have the
ability to rant much better than I so I'm going to bow out now. Maybe
Stinson will continue to give you more rant opportunities. I think
you're a nut and I'm going back to messing with radios.

-Adios,
Bill M

Yes, I have one of these clocks also. The thing is, these clocks
are set 6 times in a 24hr perod by the WWVB signal. The rest of the
time the time base is an ordinary crystal. I want my clock to be
set on a more continous basis. This could only happen with the
continous decoding of the signal. This is how the "professional"
clocks, such as those made by Spectracom work.

You might consider the old Heathkit clock, which still turns up cheaply
at hamfests now and then.

If you build your own, make sure you use nixie tubes. That's important.

FS Nice Drake TR5 Transceiver and matching Drake PS-75 Power Supply.
This is very clean gear. It does works,
but needs an alignment. Receiver sensitivity is low. Calibration is good
and the digital readout is bright and clear. Everything works. I have made
several contacts and get good audio reports. It puts out around 90 watts, a
little more or a little less depending on band. The rig includes the
original manual and all cables. Price is $575 plus shipping. Digital
pictures available. Thanks, Charlie Hugg, K5MBX

And in the true Ham tradition, be sure to scrounge them from a defunct HRO-600
:-)
Ripping off an old HP freq counter is second-best.

Real content: I used to listen to WWVB on a huge old Navy regen RX (RAL or the
like?) and could get it day or night on a Sloper antenna. Nothing I own now is
sensitive enough down there to pick it up. The signal is pretty weak and I am
really amazed at the little clocks that can get it. I bought one on sale from
Rat Shack and it doesn't lock on until late at night.

BTW, whatever you buy or build, be sure that it displays seconds. Seems a
waste to have a precision clock that doesn't show them. My Rat Shack clock
does not, but I know it's dead-on because the minutes digit flips just as WWV
(10 or 15 MHz) does its "beep."

Be careful with this. I haev an ICOM 706 which I have been listening to
350kHz beacons and I suspect sensitivity is not an issue. The receive is
not selective enough to keep out much noise. Below about 200KHz I heae
locam AM broadcase stations. Some kind of IM or something. I want to build
some kind of a low / band pass filter to see if it makes a diff. The
specific antenna can also make a diff. I'm using a 40M dipole.

I have the following items for sale that are excess to my needs. Prices
do not include shipping. I will ship overseas.

Solar Capacitor Exam-eter Capacitor Checker.......$75 plus shipping
This is a multi-function Capacitor tester which tests capacitance,
resistance, power factor, leakage, and insulation resistance. Also has
an ac/dc VTVM built-in. This is a working unit in nice condition.
Includes a copy of the manual.
http://members.cox.net/radiostuff9/exameter.jpg
http://members.cox.net/radiostuff9/exameter2.jpg

Weston Electric Vintage AC Voltmeter and AC Ammeter.........$40 plus
shipping
These are neat bakelite meters that must be 50-60 years old. Voltmeter
covers 0-300 Volts in two ranges through two separate binding post
connections. Ammeter covers 0-20 amps in two ranges.
http://members.cox.net/radiostuff9/ac_meters.jpg
http://members.cox.net/radiostuff9/ac_meters2.jpg
http://members.cox.net/radiostuff9/ac_meters3.jpg

Precision Apparatus Series 85 VOM.........$30 plus shipping
Vintage well built VOM. Tested and working.
http://members.cox.net/radiostuff9/series852.jpg
http://members.cox.net/radiostuff9/series85.jpg

Triplett 630-PL VOM.................$25 plus shipping
Nice working VOM. Needs new battery for highest resistance scale-all
other ranges are OK
http://members.cox.net/radiostuff9/triplett2.jpg

Knight Amplifier...........$40 plus shipping
Knight Kit amplifier from Allied Radio. No model number on the unit. I
believe this unit is from the
late 1950's or early 1960's. I have checked it out and it works. I had a
matching tuner for this a year
ago and it too did not have a model number.
http://members.cox.net/radiostuff9/knight_amp.jpg
http://members.cox.net/radiostuff9/knight_amp2.jpg

RCA Advanced Voltohmyst VTVM.............$35 plus shipping
Older RCA VTVM in working condition with probes. Case has been
repainted.
http://members.cox.net/radiostuff9/rca_voltohmyst.jpg
http://members.cox.net/radiostuff9/rca_voltohmyst2.jpg

Weston Antique Milliameter.....$30 plus shipping
This is a neat antique meter. Working in very good condition. Measures
15, 75 and 300 mA through
seperate binding post connections.
http://members.cox.net/radiostuff9/weston_meter.jpg
http://members.cox.net/radiostuff9/weston_meter2.jpg

Book - "The Portable Radio in American Life" .....$25 plus shipping

This is a 260 page book published in 1991 covers the
history of portable tube radios and transistor radios from the 1920's to

the 1970's. Includes historical information on Sony, Zenith radio,
Admiral radio and many other brands who built portable radios. This is
an excellent reference book if you collect portable and transistor
radios. These are new books. This is a great radio reference book. I
have 1 of these books left.
http://members.cox.net/radiostuff9/portableradiobook.jpg

Set of crystals for the Navy TDQ transmitter...$60 plus shipping
Their are 24 crystals of which 23 (a few duplicates) are the original
Navy crystals; one crystal is not.
The wooden box is in great shape also. Here are the frequencies all in
MHz: 5.80,12.90,13.10,
13.26, 13.50, 13.74,13.75,
13.82, 14.02, 14.02, 14.30, 15.62 ,15.64, 15.66, 15.68,15.78,15.84,
15.85, 15.86,15.86,15.86,15.92,15.92, 16.00, 16.24
http://members.cox.net/radiostuff9/tdq_xtals.jpg
http://members.cox.net/radiostuff9/tdq_xtals2.jpg

Thanks for looking.

If expecting those who write here to back up their posts with facts, attribution to verifiable names, and/or citations from reputable sources is insane, then call me a nut. If I'm having fun exposing GOP FUD for what it is, then I'll keep laughing while the voters - you really _can't_ fool all the people all the time - send the junior Bush back to the farm.

Just remember that I didn't start it, have never pretended to be anything I wasn't, and have never started ad hominem attacks on those not in the limelight. Please feel free to come back and stand on the soapbox anytime you can support yourself with resonable and well-researched argument.

I'd say I support your right to do so, but I think that's already obvious.

Absolutely. In fact, Kerry, in a speech to the Council on Foreign Relations last October, stated that he would cease the war on terrorists, would negotiate with terrorist states, would APOLOGIZE for the actions of the United States so far, and would return terrorism to a "law enforcement issue" rather than the declaration of war it rightfully is.

This is the exact policy followed by the Clinton Administration, which led to the events of Sept. 11, 2001.

The safety of my family is far too important to risk ever voting for a demonstrable ignorant buffoon like Kerry. President Bush has taken exactly the correct path in fighting the war on terror.

You should have heard 75 in the late 50, early 60s. That is when you had
wall to wall carriers and assorted hetrodynes from 3.8 to 4.0 every single
night until wee hours of the AM.

Got a couple of am 912 amps from fair radio sales. I am looking for info on power supply design for these rigs. I plan on using one on 144 and the other on 220. Initial plans are to use a bridge rectifier for hv then come of the center tap of the transformer for the screen voltage. I want to regulate this with a shunt regulator using a power FET, any thoughts. I have more trouble with metering than with anything else. Also I am planning on using a 4cx250 in them eventually. Should I use a 6 volt filament transformer or cut it back to 5.5. I know you have to do this at 432mhz but dont know about 144 and 220.
TIA Jimmie

You'll find that most of the schematics on the net for atomic clocks are
of the crystal variety-they set once or twice a day with WWVB and the
rest of the time use a crystal. You'll have to do some digging to come
up with something that does continuous decoding, but I'm sure it's out
there.

I was there, sometimes with, and sometimes without, carrier. I enjoyed 75 meters, and didn't mind the QRM - It was just part of the ham game. It was a good band to connect up with friends and acquaintances. AM is much more sociable than SSB just because you can recognize a voice without careful tuning.

It was rare back then to encounter a foul-mouth.

The HQ-150 wont need the one with the Q-multiplier since that receiver has one built-in. Paul, you will find that to be a very sensitive tube radio. I also find that Q-multiplier to be an amazng aid to copying weak ssb signals.

Taking a page from Shrub, maybe? Bush wants all kinds of
"transparency" and "accountability" for everyone except the swells who
surround him. Try getting transcripts of Cheney's meetings with the
energy industry when our national enregy policy was being written.
That's at least as relevant to his fitness to govern as whatever went
on thirty years ago.

Steve -

You suspect correctly. That is why the antenna preamp for the HP 117A
VLF Comparator incorporated a magnetorestrictive 60 kHz filter with a
half-power bandwidth of 30 Hz.

Pretty sure that the best antenna is a loop -- a big one with lots of turns,
and a fat cap to resonate it to 60 KC. Maybe not practical. Or use a big
ferrod loopstick and wind LOTS of turns on it.

And like you say, many RX suffer from intermod and images from the BC stations.
A low-pass filter would probably help a lot. A resonant loop would of course
eliminate all that stuff.

I haven't cracked my Rat Shack clock open, but I suspect there's some kind of
loop antenna inside. --Mike K.

I do remember that, vaguely. Isn't that the era when every good receiver had a
slot filter, notch filter, or Q-Multiplier reject filter? These lasted thru
the transition era from AM to SSB, when the sidewinders really had to suffer
those hets!

> things: just ask Rusty Calley if you don't believe me. Some of it, I saw
> with my own eyes, some I read in the courts-martial and/or arrest reports I
> saw as a Military Policeman.

That Calley trial was a biggie but a biggie because his act was so rare. Given the political climate after I got home, if there were other such events they would have been jumped on by the press and Service. If you were military police attending Courts Martial of people who did bad things that is also a statement that soldiers were monitored and if they f'd up they .were brought up on charges. The remains of people, men, women, children horrendously murdered by the VC-NVA represent actions never addressed, and they represent many MANY Mai Lais.

That was over for me on 5 May 1968, Hue, Dong Ha , Qua Viet, discharge in San Francisco. Today, however, as a lifelong registered Democrat I will not-can not vote for Kerry. I feel no trust. He represents a very left highjacking of my party by '60s types who hate the Constitution, Bill of Rights, fellow citizens, and America in general. Sorry, Kerry and his ilk would not be good for our country or any other country'

What I did is use a GPS-disciplined receiver to give me a highly accurate 10 MHz standard. The receiver costs $250 from www.buylegacy.com but you'll end up paying (way too much) for a power supply/line lump and the antenna. I also spent money on software to use with it on my win2k box.

Every 10 minutes that software updates a web page with the sky view and how the high-grade crystal oven is functioning, including estimated error over 24 hours if it loses contact with the GPS satellites.

Thus far, the name-calling has been initiated by WW. He has chosen to use the term "Shrub", so I suppose we are now free to degenerate to his level and refer to Mr. Kerry as The Curr. Further, anyone who disagrees with WW will be given the label of a "GOP PR type." Yes, WW seems quite adept and at ease wielding a smear technique

It's unfortunate that the Democratic machine has chosen to conduct the initial 2004 campaign by attacking the President's moral credentials. Desperation and hatred color and distort their entire position.

You are free to call John Kerry whatever you like: it's a free country,
after all. :-) I am free to call George Bush whatever I like, so long as
it's clear that I'm voicing my personal opinion. Both men are standing for
election to public office, and it's not a game for the faint-hearted.

I don't label "anyone who disagrees" with me: I used the "GOP PR" metaphor
as a sarcastic reply to an unattributed, and untracable, piece of
disinformation. If it wasn't clear to you that I was being sarcastic, then I
suggest you need to get out more: please recall that within 24 hours it had
gone from being the alleged report of a "Retired Rear Admiral" to being a
putative contribution by "Marine Master Sergeant" in a chat room, and I
think I was able to shoot _that_ nonsense down as well.

I don't, and haven't, smeared anyone: I've never lied and I never invented tall tales about George Bush, but if I call him by a nickname you don't like, well, as I said, it's not a game for the faint-hearted. I think he _is_ a Shrub compared to his father, and I think his father was a dwarf pine to begin with.

As I said, I don't attack those "not in the limelight". You, for example, are simply a ham operator with an opinion to share.

Me too.

How? In what way? _WHAT_ moral credentials?

Have at it. Bring it on. Stand up and be counted.

You have the right. ;-)

Bill

1728. eBay Yaesu FR-101 - Dead bands - need help

Newsgroup: rec.radio.amateur.boatanchors
Date: 2004-03-10 14:06:43 UTC
From: Brian & Deb Wingert <wingert@drizzle.com>
Message-ID: <1078927777.641403@yasure>
Source record: 24989

I recently purchased a Yaesu FR-101 receiver on eBay. Everything checks out except for the bands from 10 mhz to 25 mhz. The bands above 10 mhz work and the bands above 11 meters work. The middle bands are dead.

I tried cleaning the band switches. So far, it hasn't helped.

Any suggestions would be appreciated. Thanks, --- Brian N7RVD

Honestly, it's not too expensive to get these made up by ICM or JAN.
Certainly worth the fifteen or twenty bucks per band.

TK,
```

For a normal 'ordinary' Consumer Time Standard that is Accurate to
within a Tenth of Second: Every Minute; Every Hour; Every Day . . .
The above Time Synchronization Process is more than adequate.

Go read this, it even gives the Marine Master Sargent's name, you can
call him and verify it yourself.

> Correction, Marine Major.

You post implies that you have confirmed the authenticity of what was
originally posted here, and that's not the case: the material at that URL is
an opinion piece by a commentator, who quotes nine sentences from the former
Major Stolz, none of which appeared in the original post or the followup
that I responded to. I stand by my opinion concerning my previous messages:
that there never was any such thing published in a chat room, by a "Retired
Rear Admiral", a "Master Sergeant", or anyone else who was ever in a
possition to know didly about the 'nam. It's GOP FUD, plain and simple.

As to _this_ publication: it's author, Thomas D. Seigal, says at the start
of the second paragraph that

"I would argue that anyone who experienced shots fired in
anger has the right to ask questions about any other person
who makes similar claims. "

... but he does not provide any information as to whether he or the two officers he quoted were ever in Vietnam or even in combat : in its absence, I assume they were not.

Let's leave that aside, though: there is a larger issue, and it is getting swamped (no doubt as the spindoctors at the RNC planned), in minutiae about whether John Kerry acted wisely in conducting operations during close-order combat. I submit that it is unimportant whether Kerry "should" have gotten off his boat or whether he "should" have acted differently under fire.

Senator Kerry was a commander of a combat crew that was regularly involved in life or death struggles with hardened, experienced Viet Minh cadres, at the same time that the current President was evading even the minimal obligations to the Texas Air National Guard which his father had arranged for him.

There's a phrase that's used a lot in substance-abuse counseling: "Don't should on yourself". I don't care what Kerry "should" have done: he was there, and Shrub wasn't.

Bill Warren

P.S. This really has gotten too far off the subject of ham radio. I've set the followups to talk.politics.

(My email address has an anti-spam meassure you must remove for direct replies)

As of two or three days ago (when my photos went in), the new layout, with menu selection for each piece of gear, was really convenient and working well. Time for me to take another look....

Still wondering if the C-B O-scopes had a 4-prong ('80) socket for the plug on the various Wobbulators.

Also, that multi-panel Radio Analyzer reminds me of the more compact Meissner job with sig gen, tuned tracer, audio tracer, VTVM, and four magic eyes. Someone should start a Meissner site -- not me, since my host is already tight on space. But I could send some terrific photos. --Mike K.

Source record: 24901

I just received the following from a friend who has been building electronic circuits for his home pipe organ (talk about boat anchors). He got shorts in a solid state circuit, so imagine what the new solder he describes would do in high-impedance tube gear!

Apparently some solder makers are using a new "organic" flux that cleans off PC boards easier, but is conductive. I quote:

At the point that I had completed 5 of these, I ran out of my usual spool of Kester solder and began using another (spool of Kester solder). I recall that the odor of the melting flux was strange and different than that of the older spool.

Now I discover that the flux residue on the new spool is CONDUCTIVE! It's easy to discern the difference between the old and the new: the earlier "rosin" material was yellowish and hard, and when you picked at the edges of it, it would break off in hard granules. The new residue is clear and soft, about the consistency of ear wax. (The label on the spool says that the flux is "Organic," so perhaps it *is* ear wax.)

Several years ago I worked on some sat com equipment that used this stuff.
Miserable stuff. The synth circuits went bananas. I spent many hours cleaning
boards up and resoldering with "real" solder.

My guess is that is is water-soluble organic flux. If so, then it should be
washed off
the board with hot water.

For long term reliability, fluxes should be removed anyway. Regular rosin
flux needs to be
removed as well, but requires solvents to do it.

The water soluable flux was designed to eliminate the need for solvents,
which might cause
air quality or environmental issues.

The main source of Eddystone spares (and service manuals) in the UK is:

Dave Simmons,
Windana House,
North Aston,
Bicester,
Oxon, OX25 6HX.
Phone/fax: UK: 01869 347 504

There is an Eddystone User Group (of which I'm a member), which publishes an excellent bi monthly newsletter of more than 40 A4 pages of technical info and advice, nostalgia, ads, etc.
The Secretary of the Group is Graeme Wormald, G3GGL, who can be contacted at: G3GGL@euophony.net

Hope that helps.

73,

David.
G4EBT.

It works fine.

The new organic fluxes are basically the same thing as the old acid flux
materials, just more soluble.

They can be removed with a water wash rather than with toxic solvents,
but they MUST be removed. If you do not deflux, they will corrode and
destroy the electronics.

A standard household dishwasher will work for defluxing boards.

Tell your friend to read the data sheet on the solder next time before
buying it. The Kester data sheets have all sorts of warnings about
this and about the importance of defluxing.

These are very popular for mass production applications, because they can
be defluxed very easily. This is a big win for high-Z circuits. But you
must deflux.

Hi Mike,

That is the new (10 years old - new) almost environmentally correct
solder flux. It is citrus based (IIRC) and is meant to be washed off
the board with hot water and detergent. Do that and it is the simplest
stuff to use.

I don't use it, though, because its fumes stink so bad that I am sure
they must be bad for me. So I continue to use rosin core solder, and
then use isopropyl alcohol to remove the flux.

You shouldn't leave flux on any solder joint. If you are steadfastly
determined to do so anyway, there are several fluxes available in the
Kester solder line that leave a very minimal amount of residue.

AM was and is cool. Unfortunately, SSB is much better for everyone. I remember the AM days well, too, and I had a lot of fun with it. And yes, it was a mess back then.

I think that the bands are much easier to navigate now, without the AM, but it is still good to hear the few who choose to run it from time to time.

I've been really impressed, actually with my new TS 2000 and it's DSP function -- not for rejection of interference, actually, but for its ability to open up to about 3 KHZ for SSB and really appreciate the fidelity that is hidden in some of the better SSB station's signals. Of course, most are limited by their transmission filter characteristics, but it actually sounds pretty good.

I knew it had to do with defluxing in a less polluting way. I had heard back
then at Bell Labs that someone had come up with a citrus-based defluxing agent
that worked on the usual rosin flux, but I must have heard it wrong.

>I don't use it, though, because its fumes stink so bad that I am sure

Surely you're not saying one should deflux a tube socket, wired chassis solder
joint? I can see defluxing PC boards, but I've never heard of defluxing a BA
style solder joint, and it would be downright near impossible. Well, maybe
with a dozen Q-Tips and an hour of work. Did factories deflux BA chassis?

Anyway, my buddy swore he'd deflux things now. And he'll be more careful to
read the label before buying any solder. --Mike K.

Hi Mike,

I have seen it both ways in old tube gear. I have seen plenty
of mil gear that was defluxed. I have seen plenty of consumer
gear that wasn't.

The process of defluxing involved dipping or spraying the chassis
in carbon tetrachloride, or later trichlorethylene. Flux comes off
easily when it is fresh.

I wash all joints I make, be they PC board, or otherwise with
isopropyl alcohol and a brush. If I can reach the joint with a
soldering iron, I can reach it to deflux it.

Someone has. We use it at work, and it's okay. It's nowhere near as
effective as the fluorocarbon stuff. It's definitely more effective than
isopropanol.

I don't normally mind defluxing with isopropanol, although it can take a
lot of elbow grease. But it can be a problem for very-high-Z stuff like
condenser mike front ends, and of course it's impossible in a production
environment.

Not often, but sometimes you will see terminal board construction that has
been defluxed, especially on old military radios which would be used in
wet environments. They used to have dip tanks for the job, although today
a spray can of Flux-Off would do the job nicely.

My super good working Marauder (HX-10) decided to eat its power transformer a couple weeks ago. Everything else is there (filter caps are not originals). Any or all of the rest is for sale. What do you need? E-mail your needs (or do you have the transformer so I can put it back on the air???)

Mine is set only once per day, sometime between midnight and 4 am.

I was under the impression that the reason this was done is that the
signal is too weak to be decoded during other times of the day. In fact, I
have some (admittedly very inexpensive) atomic clocks that have *never*
decoded the signal here in Florida.

I wish someone would do a Hammarlund book, like what Chuck Dachis did for Hallicrafters. Yes, the HQ-170/180 pretty much ended the line, along with the Super Pro 600, though there was a solid-state HQ-215, that didn't look much like a Hammarlund.

>Is there a comprehensive list of the various Hammarlund models, showing
>their capabilities, produciton dates, and specs?
>I'm not looking for engineering drawings, but if some posts an HQ-150, I'd
>like to know what it's capable of.

Your best bet is the book on all makes, "Shortwave Receiver Past & Present" by Fred Osterman. It has a capsule history of all major makers and detailed descriptions (features and tube lineup and functions) for every model. The Hammarlund chapter is 12 pages. But the book covers only back to 1945.

For the HQ-120 and 129X, get "Communications Receivers: The Vacuum Tube Era" by Raymond S. Moore. It's just as good in most ways, better in terms of odd models, and goes back to 1932 (Comet Pro). 13 pages of Hammarlund.

Either book will give you frequency band coverage, dual conversion, selectivity controls, and the like. Osterman's gives published specs like sensitivity.

National could use a good book too. Of course the above two books cover National, Halli, etc. just as well as Hammers. --Mike K.

Mike:
Many of the older acid fluxes were highly conductive but most of the newer ones are not - some are even no-clean fluxes that don't have to be cleaned up at all.

1772. SX-28A Problem - Need Help

Newsgroup: rec.radio.amateur.boatanchors
Date: 2004-03-12 04:17:18 UTC
From: freddy <fred@nospam.net>
Message-ID: <1052eet46u3nocb@news.supernews.com>
Source record: 24933

This is a question for a SX-28A expert out there.

Well, I've really done it now. Elmer has struck.

I had a wax cap heating up in the RF Deck and so I went in and replaced the bad caps and resistors in the 1st, 2nd, and mixer boxes. Not fun. I really didn't want to, but I didn't think it was going to last long. I marked all the wires as I dis-assembled thinking it would be easy to re-assemble.

When I got to the point to hook up the wires connecting to the 4 pins on the top of each metal box I found the wire marker fell off a blackish wire. It looks like it should connect to the mixer box pins, but I don't know which one. It doesn't seem long enough to reach much of the other boxes but I suppose it's possible to get to the 2nd stage maybe.

The "mystery wire" is blackish color, and I think it goes to a terminal strip connector. A 1K resistor goes from that terminal strip connector to the 6L7 pin 4. I think it should connect to 1 of the 4 pins on top of the metal mixer box but I can't figure out which one.

Does anyone have a diagram of the wire connections to these boxes?

As SX-28A is on side with IF cans on top, from bottom of chassis the view looks like this: (Oscillator box not shown)

<==Front Rear ====>

```
1 2 3 4 5 6 7 8 9 10 11 12
| | | | | | | | | | | |
|--------------------| |----------------| |------------|
| Mixer Box | | 2nd | | 1st

Hi,
What is the best homebrew antenna our there to make? I have a 50ft tower that I have had a 22ft something omni telescoping aluminum antenna with some as long as possible ground planes (4). It works good on most bands, I have a good antenna tuner. I have to bring it down and fix it so wondering what alternatives are available to throw back up. I like to keep the omni style. What would be a practical length for the whip and or is there a copper wire style antenna that would perform better? Thanks for opinions!!!

So is gasoline, but there you are pumping it into
your car every week... sniffing the fumes that waift
up to your nose, wiping the spillage from the leaky
nozzles off of your hands.

I was involved in industry back in the hay day of
trichloroethylene. It was used in careless and ridiculous
ways. We had open jugs of the stuff everywhere.
We used it in vapor degreasers to remove solder flux,
photoresist, just about anything. There was nothing
in use before, or since that works as well as it
does.

Perhaps it is a carcinogen, perhaps it isn't. In any case,
banning it was a "knee jerk" over reaction. It would have
been better to encourage safer ways of using the solvent.

Instead, we have spent the last 30 years playing cat-and-mouse
games with the needs of industry for a good general purpose
solvent, and the needs of the regulatory agencies to ban
anything that has even a remote chance of being harmful.

Carbon tet was the king, it got dethroned, so they replaced one
of the chlorines with an ethylene molecule, and trichlor came
about. It was banned, so they changed the ethylene to an ethane,
and then a butylene, and then a butane, and then ... The latest
in the chain is pentachloroethylene. It will be banned one of
these days too. It won't take off solder flux, or much of anything
else.

As far as I can tell from my casual research on the subject, not one single human has ever contracted a case of liver cancer proven to be caused by exposure to trichloroethylene. Plenty of rats have, but the amounts they were exposed to, or ingested would never happen in real life.... well, not unless you were trying to commit suicide with the stuff.

Thanks to all those who replied: the links have answered my questions and
will provide a good reference source.

Brian, since the HQ-150 is single-conversion, how well does it handle
image-rejection? Is the Q-multiplier "reject" feature useful there?

TIA.

Bill

The Q-multiplier can be used to reject any single undesired signal. It
would be as effective on an image as anything else. Problem is that if
it is occupied taking out an image then it can't be used to take out
another undesired signal.
Single conversion is not always a kiss-of-death. The real question is
how selective is the front end. If its sharp enough then images will be
supressed. After all thats where image rejection is done in any radio.

Dennis,

I don't know what you mean by ordinary crystal, but even.001% is not very good. You may want to look at high accuracy temperature compensated oscillators. Depending on where you live, you may actually be able to phase lock your oscillator to the WWB carrier. You would have to use a phase detector that does not pull you off to one side if you lose the signal. Also, the ~3.58MHz color subcarrier on some TV stations is locked to a cesium standard.

You'll need a good ground system to load a tower, and unless you shunt-feed it, you'll have to insulate it from ground as well. The good news is that it'll be fairly effective as a radiator if you do put the effort into the ground radials.

HTH.

If it were me I'd hang 3 separate dipoles, inverted vees or quarter-wave slopers off of the tower. The tower shunt feed scheme works fairly well on 40/80 but I've never had much luck at 20 and above.

My 2c.

Water soluable means the flux will absorb moisture from the air. On very dry days everything will be fine, but leave the item in a humid evvironment for a few days and just about every circuit will malfunction.

BTW, if you have a power supply with maybe 48 volts inside and a humid environment, the flux will eventually cause a carbon track to form on the PC board, and eventually it will arc over. Try it! It is repeatable, and will cause a nice fire.

CLEAN OFF THIS FLUX!!

The Q-Multiplier will not do a thing for image rejection. That would
be determined by front end selectivity, and the placement of the IF
frequency in reference to the signal frequency (ie if the IF is low
compared to the signal frequency, then image rejection is lower than
if the IF is high in frequency relative to the signal frequency).

While there was a period in the sixties when there were a fair number
of construction articles that featured front-end Q-multipliers, which
were supposed to improve image rejection (because it improved
front end selectivity), the Q-multiplier in the Hammarlund (and most
or all commercially made receivers) operate at the IF frequency, where
they only affect IF selectivity, not image rejection.

What ground system do you use? I've heard various reports about how many
radials are needed, and where/if they must/should be connected at places
other than the center: the only "hard" documentation is on AM broadcast
antennas, and I don't have the budget to buy space next to a salt marsh ...

I had a 40 meter vertical with 60 radials that really kicked butt.
Outperformed a nearby ham's 3 el "contest station" yagi in most every
case for the real long-haul stuff.

My son and I put the radials in progressively - the ant was located in
the bush in rocky terrain and was nothing more than a push up TV mast
balanced on a coke bottle and guyed with nylon rope. After about 2
dozen radials the difference wasn't really noticeable and this jives
with results I've heard from other people.
A 20 meter vertical (those push up masts are frequency agile-hehe) at
the same location was a dud compared to an A3 on a 15 foot mast further
down the hillside.

I shunt fed a tower once (60 ft with triband quad on top), no particular
ground system. Many of these schemes involve 'tuning' the ground lead
in order to get them to work. I got it to work on 40, can't recall how
80 acted but it wasn't near as good as a 1/4 wave sloper from the top of
the same tower and it kept the shack hot with RF. Again, it was a dud
on 20 and above. My guys were grounded and that seems counter-intuitive
for a vertical radiator.

I'm of the mind, based on my experience, that ground-mounted 20-15-10 stuff just isn't very effective compared to say a ground plane scenario where the antenna can be elevated. And then that raises the question whether or not an inverted vee at the same height as a ground plane is more effective. I'm not sure there's an answer to that question but vees and dipoles are easier to construct at the top of a tower :-)

I have a Johnson Valiant that needs a low voltage transformer. I need a good receiver for my AM station. I also have a Icom R 71 receiver that I will throw in too it has real weak receive and I think that a diode crapped out before the ATT RF amp and straight through circuit. This is for pick up only because it would just be to coastly to ship.I will travel 75 miles away from Athens GA. I have the manauls for both units. I also have a HQ 110 that needs C 73 and a Halicrafters S-85 receiver that is a nice working SW receiver but has no s meter and isn't worth a darn for ham radio. I also have a realistic 1000 channel pro 2052 trunk tracking scanner. I also have a TR 7850 2 mtr moblie that used for a packet station. It needs a mic. Maybe we can work something out. 73 and thanks for reading

Gerry and others,
Yes I have went thru 2 of those dam things already. A big white one
with normal minute and hour hands which I threw away after a few weeks
of trying to make it behafe. Then got the more or less square shaped
one with wooden panels on eachside of the clock face. Shows
day date weekday (seconds or indoor temp) Outdoor temp. Has an ICON
top center thats supposed to show up black if WWV is being heard.
Mine rarely does unless take it upstairs and point it north/south.
Then the icon (wwv) shows very dimly. Mine is supposed to access
the WWV sig during hours from midnight to 6am only. But still the
ICON rarely shows up. I hear the people who sell them are very
helpful and will even replace your clock if you cant resolve the
problems. Their ph nr is 1 (800) 972-0292 and ask for Shelly.
Kokomo Joe (in Hawaii)

Bill:
I generally use the HQ-150 above 5 MHz and I haven't had any problems with images. The 150 circuit is basically the same as the previous single conversion 'Hammers' and, while a bit drifty for the first 10 minutes or so, works very well. The receiver can usually hear anything my modern tabletops can. Selectivity, however, is another issue. Those old xtal filters had very poor shape factors and the skirt selectivity suffers.

Hi Brian,

I am probably going to go back to the Kester 331 water soluble flux solder. I hate the stuff. It burns my nose, eats the tips off of my irons, and just plain smells awful! But, it makes a pretty joint, works nicely even on ugly looking wires, and washes off with nothing more than a dip in warm sudsy water.

Isopropyl alcohol works, but only if you soak for 5 minutes, and then scrub with a tooth brush. You have to clean with your first solution to remove the solder flake, and most of the flux, then you have to dry and rinse with fresh alcohol to remove any left over flux that went into solution. One of these days, I am going to catch the place on fire.

Something like when they banned sacharin as a sugar substitute. They fed the rats an equivalent of 500 cups of coffee a day and .01% more rats got cancer than if they had not been fed sacharin. But the people pushing the new stuff got the old stuff banned.

Not per se, but it will notch out a het from an image signal just as well as from a legitimate passband QRM signal. Although image heterodynes do tend to drift around a lot, making them harder to keep notched out.

FWIW, my HQ-160 has a Q-multiplier that works only to peak desired signals, not notch out QRM. The passive slot filter does that (same as on the 170/180, which do not have Q-mults). Maybe the 150 is different.

Anyway, a peaking Q-mult is perfect for CW and nice for SSB, but not much good for AM.

But I was making the point that the Q-multiplier has nothing to do
with image rejection.

Your scenario is about treating the image like any unwanted signal, and
notching it out or peaking elsewhere in the receiver's passband. But
surely that only works if you're lucky. An image by definition is
a frequency that translates to the same IF frequency, and there's no
way you can knock out a signal on the image frequency if it ends up
right where your wanted signal is in the IF passband. To knock out one
is to knock out the other. The situation is identical to that in
a direct conversion receiver, where you can get good selectivity with
an AF filter, but it won't do a thing for the audio image, since it's
right there in the passband. You can only get rid of that audio
image by front end selectivity, or phasing.

On a different note, one use for a Q-Multiplier on AM is for
improved exalted carrier reception. The narrow peak works to
boost the carrier in reference to the sidebands, but the skirts
of the Q-Multiplier are relatively weak so it doesn't affect
the sidebands too much. You are in effect regenerating the
carrier, so the distortion seen with fading is reduced. A variant
on "synchronous detectors" but something in place long before such
detectors were practical.

1803. National Speaker for FB-7???

Newsgroup: rec.radio.amateur.boatanchors
Date: 2004-03-13 05:11:13 UTC
From: Dave Hollander <n7rk@cox.net>
Message-ID: <405297F0.C0DD5BBB@cox.net>

Found this National speaker at a hamfest in a bunch of junk a few months ago for $3. Finally took a look at it tonight. Looks to be close in size to my FB-7. Dimensions are 10" wide x 8" high by 10" deep. The inside is lined with wood and the National logo is embossed in the metal. It is not an electrodynamic speaker. Anyone recognize this speaker? Here are a few photos......

Forget about getting an atomic clock to set in Hawaii. The signal is
simply too weak. Atomic Time (who I bought my dual time clock from) says
that it helps if you point the antenna (apparently they just use ferrite
rod antennas-just like in a cheap transistor radio-to recieve) towards
Fort Collins, which is due east of my QTH.

Yes, that's the impression I got too. Somewhere on the net I saw a
diagram of WWVB's coverage area-it covers all of North America at night
and just a little area of the Rockies during the day.

Hi everybody,

I am looking for an AM-864/U amplifier, (also called Federal AM-864/u, Signal Corps AM-864/u, or Military AM-864/u). Doesn't matter if it is working or not.

If you have one to sell or if you know where I might be able to find one, please let me know. Please email me at elind@broadpark.no.

Thank you.

Regards,
Jon

1809. Looking for former Hammarlund employees

Can you tell me how is the transformer built (e.g. secondary over primary, or physically separated windings)? Do you see any air gap in the lamination?

I am trying to determine whether the secondary is lightly coupled to the primary. Taking into account the scope of the equipment, this could have been done to limit maximum power transfer onto the secondary.

Agreed, it does nothing to keep the image signal from entering the IF. But it
can keep it out of the detector.

>Your scenario is about treating the image like any unwanted signal, and
>notching it out or peaking elsewhere in the receiver's passband. But

>right where your wanted signal is in the IF passband.

If the image is CW, narrow-shift RTTY, or AM that isn't too heavily modulated,
you have a steady heterodyne signal that can be notched out the same as a
"legit" signal. If it's full of sidebands or laid over a critical part of the
desired signal, then I agree, you wish you had image rejection in your front
end.

Of course a lot of "legit" QRM is for the same reasons impossible to notch out.

Yes -- I once had a CV-157 which had a very narrow (100 Hz) filter right down
the middle, for that purpose (among other modes, that being the simplest).
The problem with doing this with most Q-mults is the tremendous boost to the
bass frequencies, producing muffled, booming audio.

If you had notch filters on either side of the carrier, to delete audio freqs
below 300 Hz, this would work. In fact, the CV-57 ran the sidebands thru the
ISB upper and lower filters to do just that. You could also have a receiver
audio section that attenuated bass freqs, though very few comm rx have a switch
or knob for this (Drake R8 is a welcome change).

Charlie

I'd shoot for a bit more than -65 dB. A good Sinclair notch duplexer
can easily exceed -95 at 600 kHz spacing. I wouldn't good for much
less than -85 dB on a two meter system.

I am looking for a parts unit for any of the HP 8557 and higher series of Spectrum
Analyzers. I need especially the knobs, front panel and switches complete and don't care
if the unit works or not. The more complete, the more I'll pay. If you only have the knobs,
I'll take them. Please advise condition and price on reply.

Remove NOSPAM from e-mail to reply.

Thanks,

WB8ICT

>Or, might buy your junker amp.

Honestly, putting old bad capacitors in there to replace existing old bad capacitors does not seem like a step up.

Do it right. If you want to keep those nice metal cans, either use brand new replacement cans (Antique Electronics Supply carries them), or take the old cans out, scoop the guts out, and use RTV to mount some new modern Panasonic capacitors inside the cases.

You put ROE caps in there, and you'll be right back where you started in a couple years. The 450V Panasonics are not expensive and they are solid and reliable. Get the 105'C versions.

When mounting the panasonics
the pin spacing will probably be different from the old ones. You can
use one of the old mounting holes for each capacitor and drill a new
hole for the other one.

Look at the bottom of the board and you can figure out where to drill
the hole so the pin will come through into the proper land. No jumpers
needed. Be sure to find the proper position so that all the capacitors
fit nice on the board and do not hit one another.

When done it will look like they belong there.

>Can you tell me how is the transformer built (e.g. secondary over =
>primary, or physically separated windings)? Do you see any air gap in =
>the lamination?

Thanks for picking up on this thread. The two windings are physically
separated, but I didn't see any air gap. The laminated iron core is pretty
heavy. Since the whole PS is rated at 8 KV at 5 mA, it must be good for 40
watts. A lot of modern xformers are wound separately form the primary for
safety isolation.

>I am trying to determine whether the secondary is lightly coupled to the =
>primary. Taking into account the scope of the equipment, this could have =
>been done to limit maximum power transfer onto the secondary.

Yes, I can see that a magnetic gap or other loose coupling would protect the
secondary winding from burning up if a diode or cap shorted. And this would
also make it possible to resonate the secondary. You may well be onto
something here.

BTW, I replaced the original .011 uF cap with what amounts to .0094 uF. I
think I remember the decimal place right.

Do you have a way of repairing them?

The final transistors have long been discontinued.
Ten-Tec themselves have said that they can't get one working with
modern replacements without a total redesign of the amp.

Apparently its a problem of the gain(HFE) of the modern devices not
being compatible with the feedback methods used. They can get it right
on some bands but not on others.

Others I've talked with have confirmed this - not just Ten-Tec.

Over the weekend I had an experience with an unusual find. I was helping a friend
clean out some junk off his back porch to go to a local swapmeet. All of the stuff
had been on the back porch a little too long. On the bottom of the pile was a
R-391! I asked how much he wanted for it, and brought it home. Part of the deal
was to trade him some broadcast quality video equipment of mine that he has had
in his possession for some time.

Unfortunately, it too has been on the non climate controlled back porch a little too
long, but with the exception of missing the 3TF7 ballast and one of the 6082
regulators, it appears to be complete. It still has the tube pullers and tools in their
holders on the rear panel, the tube pin straighteners are still in place, as is the
"Green Gear" and bristol wrench on the bottom side of the rig. Both top and bottom
covers are in place as well. This R-391 is in rough shape, but I believe that it could
be brought back. I have made NO attempt to fire it up and will not do so. I will
entertain all offers for the next two days or so, and if nothing appealing comes along,
then it goes to Ebay.

I have several pictures that I can e-mail to interested parties. I will ship the receiver
but estimate $100 for packing and shipping. I would be willing to drive up to 100
miles one-way from southwest Indiana to complete the deal in person and save the
successful party the packing and shipping costs.

I am interested in an Icom 706 MKIIG, Yaesu FT100/FT100D, a set of good
working Drake twins (T4XC-R4C-AC4), a Pentium II (or better) 400MHz
laptop with serial and usb ports, ac adapter, CD and floppy drives, 128MB of
ram and a 10 gig HD, or an offer to purchase. Thanks for your time and the
bandwidth.

FWIW, he said FR-101 receiver. However there are two series of them,
one digital and one analog.
I don't know if its much help but my IC-745 xcvr had something like 4 or
5 'bands' on the input rf stage and I once lost a similar chunk of the
frequency range. It was a small ceramic trimmer for that band that was
acting up.

I would think that it would be a nice box for a homebrew amp, though.
You get a cabinet, a power supply, and a bunch of tuned tank circuits that
you can keep. And I would assume that they would basically be available
for the asking at the end of the day at a hamfest, if they are indeed
unrepairable.

What output devices do they normally use? Are they wacky germanium types?

Source record: 24809

Hello all, I have 4 amplifiers. Station 550, it does between 200 250 watts dead key and swings to 550. This amp takes 2 watts to do this. A ameritron ALS 500 moblie amp with the 10 meter mod. 25 watts swinging to 70 will give you 200 swing to 500 with 80 amps of draw on the battery. You can run this amp more effectivly by running two 2200 uf 16 volt electrolitic caps in parallel with that battery and the amp. I have a palamore three tube amp. 12BT6 driving two 6JS6Cs it needs tubes so I have no idea what it does. Then there is the VooDoo 300 B it is a base amp and puts out about 150 watts with 300 watts of swing. The power to drive this amp is 2 watts. The Station 550 and the voodoo 300 B are broad band amp so they will work anywhere between 80 and 10 meters. I have a Johnson Valaint II that needs a Low voltage transformer. Its for pick up only. To heavy to ship.
I have a Pro 2052 trunk tracking scanner as well as a 300 watt MFJ 949C antenna tunner and swr watt meter. Sycron 1000 watt meter as well as to rerceivers. I also Have a Pentium 233 complete dialup internet ready computer. Includes monitor keyboard video cammera vidio card and mouse.
I am looking for a good amp that I can drive with my RCI 2990. Some thing with 4 811s, or 2 or 4 CX 250s, or, 2 or 4 572bs, a single or pair of 3-500s all mounted vertcal of course

I am looking for a parts unit for any of the HP 8557 and higher series of Spectrum Analyzers. I need especially the knobs and front panel complete and don't care if the unit works or not. The more complete, the more I'll pay. If you only have the knobs, I'll take them. Please advise condition and
price on reply.

Remove NOSPAM from e-mail to reply.

Thanks,

WB8ICT

Hi Folks..

I have a perfect Yaesu FT-817 QRP 5 watt MF/HF/VHF/UHF transceiver for swap only..This radio has the original box, mic and accessories and includes the following options:
A. TCXO 9 high stability oscillator
B. 2.5 KHz SSB mechanical filter by Expanded Spectrum Systems (ESS)
I am looking to swap for vintage solid state transceivers..IE. Icom 751A..Yaesu FT-ONE, FT-980, Kenwood TS-930S, etc.
Also a good pair of Kenwood T-599D R559D, or Yaesu FR-FL Twins would be considered..Or Swan 600R, 600T combination..
Let me know what you have!

Thanks,
Jeff W2NBC

I have the following Heathkit items for sale that are excess to my
needs. Prices do not include shipping. I will ship overseas.

Heathkit HD-30 Crystal Calibrator.....$35 plus shipping
Working unit in exceptionally nice condition with a copy of the manual
http://members.cox.net/radiostuff9/heath_cal.jpg
http://members.cox.net/radiostuff9/heath_cal2.jpg

Heathkit HW-2036 2 Meter Transceiver and HWA-202-1 Power Supply.....$50
plus shipping.
Nice cosmetic condition. Receiver and power supply work fine.
Transmitter is not working
http://members.cox.net/hw202.jpg

Heathkit DX-40 Transmitter Parts
Heathkit DX-40 Plate Meter...$20 plus shipping
http://members.cox.net/radiostuff9/dx40meter.jpg
Heathkit DX-40 Front Panel and Cabinet.....$20 plus shipping
http://members.cox.net/radiostuff9/dx40metal.jpg
http://members.cox.net/radiostuff9/dx40metal2.jpg
Heathkit DX-40 Transmitter-Tube Set.....$20 plus shipping
http://members.cox.net/radiostuff9/dx40tubes.jpg

Also have the chassis with the bandswitch assembly and other parts. No
power transformer

NOS Heathkit Manuals
These are NOS manuals that appear to have been purchased without the kit
as none have the check marks for assembling the item. Finding an
unmarked manual is rare unless you happen to come across an unbuilt kit.

Heathkit 2 Meter Converter XC-2 Assembly
Manual.....$60 plus shipping
Insides are excellent and the 8 foldout drawings are there. The back
cover has a a bit of shop ware and their is a small stain on the lower
left bottom of the front cover. Date on manual is 1959.
http://members.cox.net/radiostuff9/heathxc2.jpg

Heathkit AC-1 Antenna Tuner Manual- NOS.....$50 plus
shipping
Insides are excellent and the 2 foldout drawings are there. The back
cover has a a bit of shop ware. Date on manual is 1957.
http://members.cox.net/radiostuff9/heath_ac1.jpg

Heathkit SB-10 Single Sideband Manual - NOS.....$60
plus shipping

Insides are excellent and the 4 foldout drawings are there. The back cover has a a bit of shop ware. Date on manual is 1958.
http://members.cox.net/radiostuff9/heath_sb10.jpg

Heathkit HW-19 Manual 10 Meter Transceiver.....$50 plus shipping
This is the ten meter version of the lunchbox (Twoer). Insides are excellent. The back cover has a a bit of shop ware. Date on manual is 1960.
http://members.cox.net/radiostuff9/heath_tenner.jpg

Heathkit CO-1 Code Practice Oscillator Manual.....$20 plus shipping
Insides are excellent and the 1 foldout drawing is there. The back cover has a a bit of shop ware. Date on manual is 1959.
http://members.cox.net/radiostuff9/heathcpo.jpg

Heathkit HD-19 Hybrid Phone Patch Manual.....$20 plus shipping
Insides are excellent however their is a small bit of water damage in the lower left bottom of the pages. None of the page are or were sticking together The back cover has a a bit of shop ware. Date on manual is 1958.
http://members.cox.net/radiostuff9/heath_patch.jpg

Heathkit AM-2 SWR Meter Manual-NOS.....$20 plus shipping
Insides are excellent and the 1 foldout drawing is there. The back cover has a a bit of shop ware. Date on manual is 1959.
http://members.cox.net/radiostuff9/heathswr.jpg

Heathkit B-1 Balun Coil Manual - NOS.....$15 plus shipping
Insides are excellent. The back cover has a a bit of shop ware. Date on manual is 1957.
http://members.cox.net/radiostuff9/heath_balun.jpg

Non-Manuals

Heathkit Catalog - Winter 1985.....$10 plus shipping
Very good condition.
http://members.cox.net/radiostuff9/heathkitwinter1985.jpg

Thanks for looking.

==========
John:

Before you replace that power transformer be sure to remove/replace
C-118. That is the 0.1 uF capacitor connected from pin 4 of V-17
(5Y4G) to the chassis. A shorted C-118 is probably what burned out
your original transformer. A shorted C-118 is a well-known problem
with the HRO-60 and it results in instant destruction of the power
transformer. That capacitor serves no useful function and should just
be removed. If you wish to replace it (and I wouldn't) be sure to use
a new capacitor rated at 630 VDC or better. And don't be fooled into
thinking that the AC line fuse will protect the power transformer - it
won't!

Best Regards,

Ed

The topic is WWVB, the binary signal. WWVH is the voice signal, which an autosetting clock will not understand.

That may be the case Scott, but the 'atomic clocks' they are speaking of use
the WWVB signal from Ft. Collins, Colorado on 60 KHz to set their time
automatically.

That signal may indeed not be propagating well enough to be of use in Hawaii.

I agree with whoever said WWVH in Hawii is l/c and on same status
as wwv in Colorado, so these "skyscan" clocks should perform as
specified. I found though that my latest one will keep time
right to the second for a period of time, the I have to move it upstairs
where reception is better and leave it there for 24 hours. Once
reset to exact time tick I again put downstairs in the shack and its
good for another momth or so. I fail to see how the clock reader
can discriminate between WWVH (on Kauai) and WWV in Colorado.

But most atomic clocks use WWVB on 60 khz out of Fort Collins. WWVH, to my knowledge, only uses HF freqs (5, 10, 15 Mhz). But yeah, I'm sure the rice keeps better time than the people who eat it. :)

I heard the LuaLuaLei transmitter a lot, but not WWVH, when I lived there.
500kW or 1MW IIRC, somewhere around 24kHz.

That number is a dud, but searching for "Pierson" brings it up along with 38 unrelated items.

Looks very fine, and the manual is a big plus.

I have the same RX with ACPS/speaker, as shown in the manual, but no manual. I'm not in a hurry to sell mine, but could be tempted. (I'd rather get rid of the big stuff first). --Mike K.

1871. FS: Heath DX-60 Transmitter: GR-78 Receiver

Newsgroup: rec.radio.amateur.boatanchors
Date: 2004-03-17 18:21:54 UTC
From: Bruce Stock <ab7yd@earthlink.net>
Message-ID: <6H06c.44805$aT1.40564@newsread1.news.pas.earthlink.net>
Source record: 24832

This posting is for the following items:

1) DX-60 Transmitter
2) GR-78 SWL receiver
3) GR-78 parts receiver

I will pack free, buyer will pay shipping.

1) The DX-60 transmitter has been checked out and used on the air for AM contacts on 75, 40, and 10m. External cosmetics are good, with some minor scratches on the case but excellent front panel paint. There is minor rust under chassis only near the audio section (see picture). View the item at:

http://home.earthlink.net/~ab7yd/misc/dx601.jpg
http://home.earthlink.net/~ab7yd/misc/dx602.jpg
http://home.earthlink.net/~ab7yd/misc/dx603.jpg

price: $60 plus UPS ground shipping from 98144

2) The GR-78 was Heath's upgrade to the famous Mohican SWL receiver. It adds a calibrator and LF coverage, plus a smaller package. This receiver is working fine. It includes the internal NiCad battery, which is disconnected and may be rejuvenated. I have been using the receiver with the attached AC supply (which will be included.) Comes with the original Heath factory manual. View the item at:

http://home.earthlink.net/~ab7yd/misc/GR78a.JPG
http://home.earthlink.net/~ab7yd/misc/GR78b.JPG

Price: $70 plus UPS ground shipping from 98144

3) This GR-78 receives fine, but is being sold as a parts radio because the speaker is scratchy and the bandspread gearing is not working. It includes the internal NiCad battery, which is disconnected and may be rejuvenated. I have been using the receiver with an external DC supply (which is not included.) View the item at:

http://home.earthlink.net/~ab7yd/misc/GR78c.JPG
http://home.earthlink.net/~ab7yd/misc/GR78d.JPG

Price $30 plus UPS ground shipping from 98144

Regards, Bruce AB7YD

Hello.......Group. Does anyone need anything Picked-up or hand! Delivered.
Anything large and fragile (everything is handled with TLC.) Specifically:
...
(Mixing Consoles, Radios, TV's, Tape Machines, ALL types of recording
equip., Speakers, Transmitters...Boatanchors.
Etc. Jukeboxes. Pianos, Organs,).
I do this every few months for a growing group of Radio, TV, Recording
musicians, Collectors, etc.
I am leaving in a few days from the West Coast (LA. SF.....)
Then across the country for points Back East.....Down South....(AZ. New Mex.
TX. ....Fla.)
Then Up to New Eng. & NJ. NYC area.
Pretty much anywhere needed?
I will have a good amount of room left.
Please contact me as soon as possible to discuss my schedule and your's.
References available.....Thanks.
Call Cell for immediate response......!

Mike

I thought WWVH also had BCD data a couple times an hour? Or has that been
stopped along with the Omega navigation beacons?

Is there no VLF facility in Hawaii comparable to WWVB?

They don't use WWV or WWVH. They use WWVB 60 kHz out of Fort Collins.

The data sent on 60 kHz by WWVB isn't transmitted by WWVH. Here's a
chart of the coverage areas of WWVB and it looks like it has a decent
chance of being received in KH6-land at certain hours, like 0800 UTC.
http://www.boulder.nist.gov/timefreq/stations/wwvbcoverage.htm

WWVH is the 2.5, 5, 10, 15, and 20 MHz voice and data transmitter, it's on
exactly the same freq as WWV in Ft Collins. If you listen, there's a
silence before the guy on WWV speaks, that's for the lady from WWVH to talk
first. (very polite :)

The clocks use WWVB which is a 60 khz signal.
Interference from LuaLuaLei may make that impossible to pick up.
There also used to be a Loran transmitter around 100kHz IIRC, on the north
shore of Oahu, but they may have taken that down now.

Up in Woburn Mass there was a company that made production line machinery for the pharmaceutical industry. They would sometimes take greasy gears out back and clean them off with trich and dump the residue on the ground. Not much, maybe 50 gallons over several years. Unfortunately, there was an underground aquifer that ran there and led to a town well. In the neighborhood the well fed, there was an extremely high incidence of leukemia in children. Big time incidence. This was very real and a great tragedy for many families.

I worked next door (Cummings Industrial Park) and used to watch the hazmat crews digging the whole place up. We wouldn't drink the town water even after they said it was cleaned up.

Just because your "casual research" doesn't come up with something doesn't mean there isn't something there.

Peter

Gee Roger KL7Q I thought that a Vallaint was a boatanchor! I have a
Hallacrafters S-85 and a Hammarlund HQ 110 (it needs C73 and a
realinment) They are offered up for scacrafice too. I'm looking for a
amp for my 10 meter operation.
Gee Rbrtmssn201 here is a lesson in changing vocabulary. Swing is
the positive peak that a properly tunned amplifier produces in such AM
sceems like screen modulation. The 6146B tube does this, below is an
example rig.
EXAMPLE: Heathkit DX-60B 15 watts of carrier with 70 watt peaks. Gee
the output meter swings! So if you dump this into say a Henry desktop
2K you get 150-200watt carrier with 700 to 900 watt peaks. Gee FORWARD
SWING! Times are changing you have the ARRL to thank for that. You
have the FCC to thank for that too. Oh and you have CB radio to thank
for that. Most of your new hams hams aprox 1 million transmitters come
from the ranks of CB aprox 5 million transmitters.
best 73 or is it 73sssssssss when you sign off from a QSO which do
you do?
vocabulary 73

Hi Peter,

Now that is a horse of a different color! In the case of industrial
use, exposure doesn't include ingesting the stuff... unless you are
suicidal, I suppose.

But, in the case of contaminated ground water, the poor residents were
drinking the stuff on a continual basis. The same problem exists where
buried gasoline storage tanks leak into the ground water. Yet, gasoline
the king of carcinoma is in general and rather casual use.

Trichlor is a real problem for ground water. It is about twice as
dense as water, so if it hits the ground, it can travel anywhere water
can, only faster. Trichlor poured onto the ground always ends up in
the ground water.

Banning trichlor because it is a carcinogen in high doses, doesn't make
sense. It is too useful a solvent. Regulating its use and disposal is
what should have been done.

-Chuck Harris

Source record: 24751

Just bought a Mackay Marine 3031a. Nice commercial-grade radio. Everything works, but I have one question. The signal meter worked at first, but after about 30 mins or so it became inoperable, resting at the far right of the meter glass. Has anyone experienced something like this? Is it an intermittant problem with the meter? Any suggestions on how I could check this?

Thanks,

Reggie

Reggie,

I'm not familiar with your particular radio, but most "S" meter circuits work by monitoring the plate current of one or more tubes which are controlled by the AGC line in the radio. As the signal strength increases, the AGC voltage becomes more negative, biasing off the tubes and causing them to draw less current.

From your symptoms, you could have one or more gassy tubes in the IF amp or RF amp, or (more likely) a leaky coupling capacitor. Do you have a schematic? If not, you should try to get one. I'd suggest measuring voltages around the tube(s) where the S meter is connected.

Hint: The old wax/paper capacitors are the source of 98% of all old radio problems. Sometimes it's best just to replace them all, then go from there.

You go to one of the search engines, and you do websearches.

You go to http://www.groups.google.com and do a search on the computer,
until you find where it's been talked about, and ask there. If you
get no hits, you search for computer related newsgroups, figuring out
whether this is a buy and sell issue, a hardware issue, a laptop or
desktopissue, or a software issue. Then you ask there.

Being lazy is no excuse for posting about computers in a newsgroup
that should not be covering anything that came after at the latest
1975 when small computers hit the market.

How in the hell can the CLOCK detector tell any difference between
the time signal from WWV or WWVH. They are both on exact same
frequecies, the time tick is identical on both !!!!
Kokomo Joe
WWVH on Kauai has a consistantly strong signal. Albeit at times
is totally off the air several times in any given month.

If the signal format is *exactly* identical to WWV it has a continuous
time signal being sent as a 100 Hz tone at 1 bps. If you can't hear
it on your radio (because of "comm grade" headphone or speaker or
ears), you can use skysweeper in free demo mode and see the bits clear
as day in the waterfall display.

Here is the WWV/WWVH time format:
http://www.boulder.nist.gov/timefreq/stations/wwvtimecode.htm

But as been mentioned before, this is a different format than what is
used by WWVB for synchronizing clocks.
http://www.boulder.nist.gov/timefreq/stations/wwvbtimecode.htm

Circa 1972, there was an ad in "73" for some new Signal Ones. A
receiver, and maybe a transmitter. My guess was it was the big fat
November issue that year, if anyone has there issues in better state
than mine. I suspect they never went beyond those ads, though.

I figured a CX-5 might have been one of those, except that I saw
no reference to such equipment beyond that ad.

That's a tall order.
The technical manual for these receivers is over a hundred pages with
many schematics for each circuit module plus a large interconnect
schematic.

You'd be best to try to get the full manual.
Ther are several suppliers of manuals that probably have it.

I have a MacKay 3030A.
I believe the differences are mainly in the tuning/readout circuitry.
Mine uses lever switches, yours uses an optical chopper/coder with LED
readouts. I do have the original factory tech manual for my receiver.
Perhaps I can help but I don't have a scanner and the schematics are
large fold-out pages.

You would probably need the schematic for the I.F,. module plus the
entire interconnection schematic in order to trace the signal meter
out.

Nope, was initially designed as an integrated station (1969), receiver
(dual) and tracking transmitter. Actually, the designation was :
CX for "Century series"
-7 for 10^7 Hz, ie 30 MHz. (Initially thought of including 6 meters, but
that was dropped before the first one was built. Almost made it a CX-8.

The 11 was a different manufacturer, never did understand the rational of
that other than it sounded good.

But that's not what I said. WWV has its own 1 bps digital signal,
every minute. If, as you say, WWVH has the same format, presumably it
also has the same 100 Hz digital format as WWV (no suffix).

No clue there except that an antenna tuner for 2M is usually a very poor
idea as line loss from elevated VSWR can make the system very inefficient,
even though the rig is matched to the line.

I worked on several of those, no tubes, no wax capacitors.
May be the zero adjustment pot, I seen them oxidize with salt crystals,
patina and behave REAL weird.
Place adrop of Cramalon D-5 on it and "rock" the wiper and re-zero (set
warm)
Check the 5 volt regulator area

If that doesn't work you will need to pick up the schematic and a can of
"freeze it"

I've seen picture of a Signal/One "receiver" in a book on receivers. It was a prototype, maybe a mock up and never saw production.

If you could find one, it would be priced "way up there".

de ah6gi/4 currently restoring a CX7A. Not bad for a boat anchor.

Hi Dale
Are there any websites or information available to explain more detailed about using antenna tuners for 2m ? I use two, one for 2m and one for 156megs frequently.

The antenna tuner does bring the reflected power down to almost 0 to the radio and improves communications both receive and transmit. Could there be a hidden damage or danger?

Thanks

>Hi,
There is no hidden danger. Remember though that a coaxial cable's loss is a
sum of its loss when matched (1:1) plus an additional loss caused by VSWR
on the line.
1. A tuner at the rig does nothing to alter the VSWR on the coaxial cable
2. at HF, where line loss is already low and most times insignificant, the
increased loss caused by the VSWR is tolerable- thus thier popularity
3. At VHF the matched line loss (the mfg specs) may become appreciable
unless large diameter cable or short runs are employed- this is where the
additional loss on the line caused by VSWR (unchanged by a tuner) can add
up quickly

The ARRL Antenna Handbook and probably the Handbook itself has a graph that
shows the additonal loss caused by VSWR on the cable as a function of
matched cable loss.

Hello all,
I have added to list of things to trade with. I have added 2 computers and 2 receivers.
I have 4 amplifiers. Station 550, it does between 200 250 watts dead key and swings to 550. This amp takes 2 watts to do this. A ameritron ALS 500 moblie amp with the 10 meter mod. 25 watts swinging to 70 will give you 200 swing to 500 with 80 amps of draw on the battery. You can run this amp more effectivly by running two 2200 uf 16 volt electrolitic caps in parallel with that battery and the amp. I have a palamore three tube amp. 12BT6 driving two 6JS6Cs it needs tubes so I have no idea what it does. Then there is the VooDoo 300 B it is a base amp and puts out about 150 watts with 300 watts of swing. The power to drive this amp is 2 watts. The Station 550 and the voodoo 300 B are broad band amp so they will work anywhere between 80 and 10 meters. I have a Johnson Valaint II that needs a Low voltage transformer. Hamarlund HQ 110 and a s-85 receiver. These are for pick up only. To heavy to ship. I'm in Northeast GA.
I have a Pro 2052 trunk tracking scanner as well as a 300 watt MFJ 949C antenna tunner and swr watt meter. Sycron 1000 watt meter as well as to rerceivers. I also Have a Pentium 233 complete dialup internet ready computer. Includes monitor keyboard video cammera vidio card and mouse. I have a 933 Pentium III box with a 8 gig hard drive and 200 meg of ram CD in a tower case with monitor keyboard and mouse. I would perfer not to ship a computer. I have a Pentium II 300 128 meg of ram and 10 gig hard drive monitor keyboard and mouse.
I am looking for a good amp that I can drive with my RCI 2990. Some thing with 4 811s, or 2 or 4 CX 250s, or, 2 or 4 572bs, a single or pair of 3-500s all mounted vertcal of course

No damage or danger. But why not just fix the antenna? Making the antenna
present a proper load in the first place will give you much better results
than trying to fudge around a bad antenna with a tuner.

Once again, the clock the individual wants plans for uses the signal from WWVB in
Ft. Collins, Colorado on 60 kHz.

How much power does an RCI 2990 put out?
You don't like 3-500's mounted horizontal?

I have the following items for sale that are excess to my needs. Prices
do not include shipping. I will ship overseas.

Heathkit HW-202 2 Meter Transceiver and HWA-202-1 Power Supply.....$45
plus shipping.
Nice cosmetic condition. Receiver and power supply work fine.
Transmitter is not working
http://members.cox.net/hw202.jpg

Eico 315 Signal Generator.....$40 plus shipping
This signal generator that covers 75 kHz to 150 MHz in six bands. Output
is either a modulated or a pure RF signal. The unit works well. The
black paint on the dial bezel is peeling. Includes a copy of the manual.

http://members.cox.net/radiostuff9/eico315.jpg

Weston Model 904 Precision AC Voltmeter....$50 plus shipping
This meter measures 0-750 volts and the ranges are changed by making the
appropriate connections on the top of the meter. The ranges are: 3, 7.5,
15, 30, 75, 150, 300 and 750 volts. This is a heavy for it's size,
working unit in excellent condition.
http://members.cox.net/radiostuff9/ac_voltmeter.jpg
http://members.cox.net/radiostuff9/ac_voltmeter2.jpg

Precision Apparatus Series 85 VOM.....$25 plus shipping
Vintage well built VOM. Tested and working.
http://members.cox.net/radiostuff9/series852.jpg
http://members.cox.net/radiostuff9/series85.jpg

Knight Kit Audio Amplifier.....$35 plus shipping
Knight Kit amplifier from Allied Radio. No model number on the unit. I
believe this unit is from the late 1950's or early 1960's. I have
checked it out and it works. I had the matching tuner for this a year
ago and it too did not have a model number.
http://members.cox.net/radiostuff9/knight_amp.jpg
http://members.cox.net/radiostuff9/knight_amp2.jpg

Telefunken AM/FM Radio.....$35 plus shipping
Vintage Telefunken AM/FM radio. The model is the Caprice 5451W. The
radio is in nice shape cosmetically with no chips or cracks. It plays
well and sounds very good on FM. AM is very weak. The dial cord is
slipping on FM but it is not broken. The two "knobs "seen on the top are
a reflection.
http://members.cox.net/radiostuff9/telefunken.jpg
http://members.cox.net/radiostuff9/telefunken2.jpg

Set of crystals for the Navy TDQ transmitter...$50 plus shipping
Their are 24 crystals of which 23 (a few duplicates) are the original
Navy crystals; one crystal is not. The wooden box is in great shape
also. Here are the frequencies all in MHz: 5.80,12.90,13.10, 13.26,
13.50, 13.74,13.75, 13.82, 14.02, 14.02, 14.30, 15.62 ,15.64, 15.66,
15.68,15.78,15.84,15.85, 15.86,15.86,15.86,15.92,15.92, 16.00, 16.24
http://members.cox.net/radiostuff9/tdq_xtals.jpg
http://members.cox.net/radiostuff9/tdq_xtals2.jpg

Thanks for looking.

I only caught the end of this thread. Is someone looking for the Paul Lee product detector mod? I know for certain I've seen it online before, and may or may not still have the orig QST article somewhere. There was also a sort of general summary of the similar mod for 4 or 5 different rcvrs published around the same time, which I might find if I have a year to look<g>. My 388 had this mod when I got it, seems pretty good or so-so depending on what your present standards are. I have to dub carefully with the BFO knob to dial in SSB but once set, I can copy across the band, or even leave it at the same setting for months. Tuning is a little touchy. But the rcvr also hasn't had a maintenance-oriented finger in it for at least 20 years, either, not even aligned, and is only connected to the ether with 10 ft of dangling wire.

Just because you haven't seen anything does not make it untrue. Thee
was no "Photoshop" back in 1972.

Like I said, there was an ad in "73" in the fall of 1972, again I'd
say the November issue, from Signal One where they detailed a few
pieces of equipment. One of them was a receiver, I think there
was a transmitter, and there might even have been another transceiver.
I can't find that issue, it must be filed somewhere else.

And yes, it was the only time I saw the ad, and I've never seen mention
of any of those units since.

But either they did mock up some units, or there were prototypes, because
there were photos in that ad.

Unless its the power of suggestion at work, I too seem to recall a
Signal One rcvr...or at least a photo of one.

Those receivers had a nice sound with the mod.....I think it was
the wider I.F. that gave it that "hi-fi" sound, along with the smooth
sounding AGC.

I was one of the design engineers back in 1969 and 1970. The company was sold (Should say given, he never paid for it) to a Jay Halliday in 1971. He ran it into the ground and the IRS closed him up. He may have had a paper thin model of a Rx, but never had the smarts or the ability to build one. Subsequent to Halliday was Don Rohrs. He built the CX11 and later models. There still was never a CX-5 or a receiver.

rec.radio.broadcasting,rec.radio.amateur.antenna,rec.radio.amateur.boatanchors,rec.radio.shortwave,rec.radio.swap

I have one of the small desk clocks that synchronizes to WWVB at
night. It auto-adjusts the internal crystal (or says it does)
to keep itself going during the day. I've found that it maintains
accuracy very well: certainly good enough for anything short of
atomic physics.

I live in the NorthEastern U.S., where the signal is relatively weak
(look at the maps at the URL a previous poster supplied) and don't
have any significant trouble with it. I looked at the NIST web
site, and I think they said something about boosting the power of
the WWVB signal: so if you had trouble with it before, it might
be worth trying again.

Yes, not to belabor the subjct, but WWVB is 60Khz,
while WWV, & WWVH are 2.5.....20Mhz.

There is no voice with WWVB. Howver, for calibration purposes
WWVB is more stable, and accurate.

No, the second ticks are 5 cycles of 1000 Hz on WWV and 6 cycles of
1200 Hz on WWVH.

You're right a wwv or wwvh clock both receive and decode
the same manner. Both wwv and wwvh transmit at 2.5, 5. 10, 15, & 20Mhz.
There is no 60Khz on Kiuai.

We were there at the same time. 69-87 for me.

I once had to put in a buried seismic alarm system right across the street
from that transmitter.
Took some interesting filtering on the signal lines, not to mention three
weeks to ditch through the coral.

I have for sale a very nice Drake L-75 HF Amplifier . It works great and cosmetics is excellent. It comes with the original manual.
This is the little brother to the L-7 and runs one Eimac 3-500Z tube and has a built in power supply. Drake did not make many of these so it is rather scarce. If you have been looking for one of these, I don't think that you will find a nicer one. Price is $750 plus shipping from 79602. Digital pictures available upon request.
Thanks, Charlie Hugg, K5MBX

>> as soon as we hit the submit button.

I'd like to continue my "bad vendor" rant.
In this one particular case the vendor hit me (after filling in the 'shopping cart' and placing the order) with a disculpatory page about how they were behind in filling orders and x amount of line items might take x amount of days. In addition to the attitude they also stated to not bother calling them about delays since it was all explained on this page and it took them 5-7 days anyway to respond to emails so don't bother inquiring via that method.
Well, ok. I was warned...AFTER placing the order.
They went on to explain how hard it is to get good people and a bunch of other fluff but left the impression that 7-10 days for an 8-line order was achievable.
That was over a month ago and that page is now gone.

My initial post solicited some comments about being respectful for the 'home-based' small business guys who don't sell on the internet as a full-time venture. I have re-ordered all the necessary things from such "one-man" vendors and every one of them replied to my emails in a matter of hours and the parts are now here sitting by the keyboard within 2-4 days.

Permit me to put a name to the ogre, Ocean State Electronics, or OSElectronics. This isn't my first bout with them - a year or two ago they simply cancelled my order without notification since 'most' of the items weren't in stock. It took 30 days and a phone call to get them to admit that.

In this instance I called on the phone and got shuffled between 800-number order takers and toll charge complaint people and they told me my order was to be shipped "tomorrow". I have already received other items ordered within days thereafter from other vendors. I'm sure their items will eventually arrive but I'm at 5 weeks already and THAT is not acceptable when they tell me they'd LIKE to ship items within 24-48 hours and some phone-droid gives me the 'tomorrow' schpiel. There's an FAQ on their website that keeps explaining away their culpability but the bottom line is they are a crappy outfit to deal with.

I'll always praise the good guys and that includes most internet vendors. Ocean State Electronics and Hosfelt are the only two on my brown list. Many people have had success with these vendors so they must not be all bad but I'd like to make it be known that these two can be very problematic.

I haven't dealt with OSE in over a year, and they were short on a couple of
items. No big deal, they offer alot of otherwise hard to find stuff. But
on one, the price for a lot 10 was cheaper than the price for 9, and they
sent 9. Otherwise, it came in quick enough. They've been OK for me, but
they aren't on my "A" list.

A nice example of a vintage unbuilt Heathkit in excellent condition.
Remote control for Heatkit GRA-2001 Televison Set. This kit contains
both the hand-held transmitter control and the receiver portion that
is wired into the the television.

The kit displays nicely and appears to be complete with all
documentation. There is some writing on one side of the box.

Manufactured by The Heath Company, Benton Harbor, Michigan.

I listened to the Coast-to-Coastam show last nite with Jim Haynie and Joe Walsh. Very interesting. I am not a ham, but am new to the world of swl. I would like to someday explore the ham world. I am a data network engineer and have worked in the Information Technology field for over 20 years as a computer operator, programmer and network engineer. Here is an observation that I have, should BPL come to fruition.

If BPL is implemented, what this essentially means is that BPL will make current PC's network connections, from laptops to desktops, and anything that currently uses a standard Ethernet connection obsolete. At the network interface, the wall-socket in your home, an entirely new device will be required to use BPL. Basically, BPL will essentially multiplex data signals over existing AC power lines. This will require an entirely new class of devices to decode the data portion of the signal from existing AC power lines into a data signal useable by a PC. Say goodbye to all existing 10BaseT NIC's, to name only one type, being the most widely used. All of the two-prong faceplates in each and every home will not be replaced, one of the so-called benefits of BPL. So how will data be decoded from the AC power lines? Of course this is possible, but the question I am posing is, what new devices will be required between your existing PC(or any currently networked device for that matter) and the wall outlet? How much will it cost to "refit" an existing networked PC that currently uses an RJ-45 type connector(or whatever)? What companies stand to gain from this new device?

BPL is not only unworkable and unacceptable from the standpoint of ham radio and the very useful role ham operators fulfill in times of emergency, not to mention the myriad of other High Frequency communications in use today, but if BPL is implemented, this will only make network computing and Internet computing more expensive. Maybe this is what the corporate interests want?

On the other hand, since this BPL would require an entirely new device, This could be a real revenue generator for a flat PC market. Think about it.

Another observation. When you build a data network in the business world, which I have done, you want to build in resiliency, which(among other things) means no single points of failure! If BPL is implemented, it would become a single point of failure for AC power supply as well as Internet connectivity, be it from terrorist attacks, black-outs, brown-outs or natural disaster.

Just some thoughts.

My sister found a 107 @ a garage sale last summer and gave it to me. She said they had it on listening to an AM station (WLS) when she saw it. The case was in great shape and it's actually pretty sensitive. The chassis looks like the owner let their cats use it for a urinal--corroded & stinky.....it's been sitting in the garage waiting for me to take it apart & look at. There's an extra tube socket (without a tube) in it, and a pot shaft sticking out of the back that doesn't belong there. I plan to fix it up a little & give it back to her. Hey, whaddaya want for $5??

Mike

Why is there such a big demand for Hallicrafters speakers? I found one on Ebay that matched the SX-111 that I am restoring. It had a replacement speaker, not the original, but the case looked good. I stopped bidding at 48.00. It closed for well over 100 dollars! Good grief, it's just a 3x5 speaker in a metal box....:)

Because some things never change. Decades ago, most guys who bought these radios figured they could do better and cheaper to find a non-original speaker. So there are many more radios than matching speakers.

I have a couple of Hallicrafters radios which need external speakers. I use matching transformers and speakers I've found at the Salvation Army store.

If you want a matching speaker, you still have to pay extra.

Because hams are cheap, and so nobody bought the original speakers with
the radios except commercial and government users. And most of those
folks tossed out the speakers years ago. The radios got kept, but the
speakers landed in the junk piles, when there were few enough of them in
the first place.

As a result, the speakers are much rarer than the radios.

I have a excellent, 75A3, works fine. Comes with : 800 hz & 3.1 khz collins and 4.0 & 6.0 Murata filters. Collins gear reduction knob and drive, HB xtal calibrator. New PS caps, w/ several new .01/.1 caps.
Cabnet nice, no extra holes, dents, etc....

AND

Collins 75S3, excellent shape, works fb, has standard SSB and CW Collins filters installed. No mods......

FOR TRADE ONLY....I WILL TRADE EVEN UP THESE TWO RX FOR A COLLINS 75A4, W/ GEAR REDUX AND 3 FILTERS. MUST WORK AND LOOK GOOD!

prefer an in person exchange..in Michigan ..to save damage due to shipping

2015. Hallicrafters S 85 question

Newsgroup: rec.radio.amateur.boatanchors
Date: 2004-03-22 20:24:29 UTC
From: Mike <marty@your_pants_starband.net>
Message-ID: <Xns94B49CBFDFE28notherecom@63.223.5.248>
Source record: 24726

I'm nearly done cleaning the chasis of this S 85. All that's left is where the ink stamps are. One stamp is an inspectors' mark. Another says Mark 1A with the number 199907 under it. The last one is a square box with I.F...109, R.F....60, and F.T....T46..T18. Anyone know the significance of these numbers?? I've got another one of these that I'm listening to as I clean & it has the same markings with different numbers (but the same inspector OK'd both of them).

Probably IF and RF are intermediate and high frequency, respectively,
and FT is final test. I suspect the numbers are employee numbers of
yhe people who did the tests and alignments.

I sorta figured what the IF & RF were for, but not the numbers....the FT had me stumped. FT as final test makes sense and the T18 would translate to Technician #18. Cool! Now for the number under the Mark 1A (199907). It's not a serial number--that's on the back of the chassis on a paper label. Any ideas??
Yea, I know. It probably doesn't matter. I'm sure these stamps will be gone by the time I finish cleaning, and curiosity has gotten the best of me.
Thanks Mike!

I would leave the marks there! I think that the "mark 1A" is the
version number. I think there is a 2A etc chassis. I don't know what
the difference is. Maybe small wiring differences.

Even if it is implemented, it's doubtful it would be wide spread. The amount of equipment necessary just to keep the signal from degrading means that it will only be available in high population density areas. It won't be cost effective out in the sticks.

Yes but in this case, he's wrong.

I said:

> I've seen picture of a Signal/One "receiver" in a book on receivers.
> It was a prototype, maybe a mock up and never saw production.

He replied:

Never even a consideration much less a prototype or mockup. Somebody
else
playing games with Photoshop.

W4ZCB

I believe that I saw it in Fred Osterman's "Shortwave Receivers,
Past and Present."

A picture in Osterman's book or some other book does not mean
that one of the several entities that called itself "Signal/One"
actually made that receiver. It does mean that what I wrote was
accurate.

I have seen a picture of a Signal/One "receiver" in a book on
receivers. Exactly what that picture represents is an unknown. It
might have been a prototype (probably not, otherwise 4ZCB would
know about it).

It might have been a mockup done by the advertising folk
(possible, lots happens that not everyone knows about. Also, that
was 30 years ago. Memories fade before photographs.)

It was not what 4ZCB suggests but does not precisely state, that
some web-weenee photoshopped it up. That is exactly what that
picture is not.

So. The mystery remains.

I've been busy but still hope to get my CX7A working this year.

Nah, aluminum is self protecting from air. It almost instantly forms
a layer of aluminum oxide, which is a sort of glass/ceramic.

Any corrosion you have on an aluminum device is due to a reaction
with an acid, base or salt. Many common houshold cleaners will really
eat up aluminum. So, if your aluminum is corroded, you need to remove
or neutralize whatever it was that was corroding the aluminum.

Yes. This is what "anodizing" does. It grows a thick oxide layer.
It is the most reactive metal, if I recall correctly. In air, Aluminum
instantly oxidizes at the surface, but this obviously doesn't completely
protect it. However, I always thought that with time the oxide grows thicker
and unevenly causing the pitting. Perhaps there are other mechanisms.
Sulfur in the air can slowly vulcanize rubber. Perhaps other oxidizers
attack the aluminum as well...

There is also a popular aircraft aluminum polish. Don't recall the name.

Source record: 24597

Want to have broadband (7-28 Mhz) 1 Watt (50 Ohms) class A solid state amplifier driving grid of 6L6 tube to about 2 or 3 mA grid current, tube is biased to about -65 Volts for class C operation with 550 Volts on the plate. I don't want to have any tuned circuits in the 6L6 grid if I can avoid it. As of now, the 6L6 has a 6CL6 driver feeding tuned grid circuit, easily gets 2-3 mA.
My goal is to eliminate the driver tube and the tuned grid circuit.

Anyone have knowledge of toroid(s) that might be required, turns ratio, material, etc.?
Do I need a more driving power ? Probably could get 2 Watts out of my driver circuit if need be.
thanks
Bob

I think you'll find 1 watt is optimistic for _output_ power on a 6L6
at 28 MHz.

So, why are you trying to do this, rather than use a tube with a more
reasonable Miller capacitance for a final?

How is the existing driver biased?

>Anyone have knowledge of toroid(s) that might be required, turns ratio,

The transformer is easy in theory, because it's not tuned. In practice
it might be a problem since the 6L6 input impedance is going to vary wildly
at those frequencies.

Looking for complete and original manuals for the HX-20 and HP-20,
part of the SSB mobile twins circa 1962. Don't have to be absolutely
perfect, but useable, with the full sized schematic included.

Respond via e-mail to:

REMOVECAPSghldbrdATccpDOTcom -- you know how to descramble this.

This is the legal limit ++ tuner that is no longer being made. It has the built-in antenna switch, auto-computing SWR meter, auto-power switching wattmeter, and built in balun. This is the preferred older variant with 1/4 inch silver contacts, not the silver plated slot head screws that can't take as much current. Have an excellent copy of the mail. No scratches, dents, dings, etc. Inside and electrically it is a 9.9 condition. Only cosmetic flaw is that some of the front panel lettering is "weak", but perfectly readable. Digital pic is available if you want me to email it. $450 and will split the shipping to continental US only.

73s,

Evan

The problem is that I that the power output meter isn't giving me accurate power out readings - it's reading too high. It has a bunch of trimmers in it, and I don't want to make wholesale changes without the correct instructions. I verified the swr with another bridge, it seems accurate enough. have a shop manual for it?

In the November 1972 73 magazine on page 148 and 149 is a advert for Signal/One.

They list a model CR-1500 dual channel receiver and the CR-1200 single VFO receiver. Also the model CT-1500 transmitter and a model CX-10 transceiver. There are pictures of these items, but they are probably mock-ups and I woul d guess they were never produced, or probably never even designed. Engineering may have not even known of these items, as a design engineer for almost 40 years, I can believe it.

Other new accessories listed are a deluxe station console and 2-meter and 6-meter transverters with direct digital readout and FM capability. Those marketing people were sure busy.
